OPERATING INSTRUCTIONS

INSTRUMENT DESCRIPTION

The 5B42 Delaying Time Base provides normal and fully triggerable delayed sweeps for the 5400 series oscilloscopes. It features edge-lighted main and delayed SEC/DIV selector switches. When used in a mainframe with readout capabilities, the SEC/DIV information is displayed on the CRT face. All front panel controls are conveniently grouped and

color coded for ease of identification and operation. Pushbuttons select various trigger modes from either vertical plug-in compartment and the various sweep modes. Although designed for use in the right hand or sweep compartment of the oscilloscope, the 5B42 will operate in the vertical compartments to produce vertical sweeps.

PREPARATION FOR USE

Your 5B42 is calibrated and ready for use when received. Fig. 1-1 shows installation-removal procedure. Refer to the Front Panel Controls illustration in the fold-out pages for a complete description of the front panel. Color patterns printed on the front panel help to identify functionally grouped controls. Blue surrounds controls

associated with the display mode, light green with the main trigger, and dark green with the delayed trigger controls. Also, the shades of grey on the TRIG LEVEL controls correspond with the grey on the SEC/DIV switch knobs for easy identification.

Fig. 1-1. 5B42 Installation-Removal Procedure.

BASIC OPERATION

NOTE

Effective SN B090000 and up, the MAIN SEC/DIV-DLY'D SEC/DIV knob assembly is manufactured with a locking pin removed from the assembly (all instruments below SN B090000 use a locking pin). This pin removal allows the Delayed Sweep to operate at a slower sweep rate than the Main Sweep rate. Avoid this type of operation to prevent illogical displays, and always set the DLY'D SEC/DIV control for the same or a faster sweep rate than the MAIN SEC/DIV control.

Triggered Display

With the 5B42 Time Base properly installed in the horizontal plug-in compartment, apply power to the main frame. Connect the CALIBRATOR output on the display module to the vertical plug-in. Adjust the vertical plug-in gain for a two division display. Push the LEFT or RIGHT TRIGGER SOURCE button, depending on which compartment contains the vertical plug-in. Push the MAIN SWEEP button in the MODE column, and the AUTO TRIG button in the light green TRIG SOURCE area. Rotate the position controls for the vertical plug-in and 5B42 until a trace is visible. Adjust the MAIN TRIG LEVEL control until the display stabilizes. Now rotate the MAIN TRIG LEVEL control from stop to stop. Notice that the trace free runs over most of the control rotation. Release the AUTO TRIG button and rotate the MAIN TRIG LEVEL control from stop to stop. Notice that the trace appears only when it is triggered, and disappears over most of the control rotation.

Single Sweep Mode

Obtain a stable display, positioning the sweep so that the start is visible. The sweep is starting on the negative-going portion of the square wave. Push the + SLOPE button. The trace will start on a positive-going waveform. Remove the jumper from the calibrator to the vertical plug-in. Depress the button labeled SINGL SWP. The READY light is now visible. Watch the CRT, and touch the jumper to the vertical plug-in input. If the intensity is high enough, a fast single trace will be visible and the READY light will extinguish. Remove the signal to the vertical, and depress the RESET button. The READY light will be visible again, and the sweep is rearmed. Release the SINGL SWP button and obtain a stable display by pushing the AUTO TRIG button, and adjusting the MAIN TRIG LEVEL control.

Dual Trace Display Switching

The button labeled CHOP in the blue DISPLAY MODE section of the front panel selects the switching mode for dual sweep vertical plug-ins. With the button out, the switching is done in the alternate mode, i.e., one channel is displayed for one full sweep, and then the other channel is displayed. This can be demonstrated by using a dual channel vertical plug-in and slowing the 5B42 sweep speed to about 10 ms/div with the trace free running. Pushing the button in gives the chopped mode.

Use the chopped mode for viewing slower dual-trace displays and the alternate mode for faster displays. Return the vertical plug-in to a single channel display and re-connect the calibrator waveform.

Delayed Sweep

Set the DELAY TIME MULT dial to mid-range. Obtain a triggered display. Push the INTENS SWP button in the blue DISPLAY MODE column. Notice the number illuminated in the outer ring of the SEC/DIV sweep dial. Set the DLY'D SEC/DIV to 1 m and the MAIN SEC/DIV to 5 m. Reduce the INTENSITY control on the display module until a portion of the display is visible as an intensified portion. Rotate the DELAY TIME MULT dial and notice the brightened portion move smoothly across the display. The brightened portion represents the delayed sweep, and occurs in one fifth the time of the main sweep according to the described SEC/DIV switch settings. The delayed sweep speed is independent of the main sweep speed, and may be set to any speed equal to or faster than the main sweep. Press the DLY'D SWP pushbutton in the blue DISPLAY MODE column; the bright portion of the display will spread across the entire CRT. See Fig. 1-2A.

Triggered Delayed Sweep

Press the TRIG AFTER DLY and the INTENS SWP pushbuttons and adjust the DLY'D TRIG LEVEL control for a stable display with an intensified portion. Rotate the DELAY TIME MULT dial and the brightened portion will jump from waveform to waveform. Push the + SLOPE button located in the dark green area above the DELAYED TRIG LEVEL knob. The start of the intensified portion will shift from the negative portion of the waveform to the positive portion. Press the DLY'D SWP pushbutton. The intensified portion of the triggered waveform is now displayed across the entire CRT. Return to the INTENS SWP mode. In this mode the delayed sweep will not start until the main sweep has passed the number of divisions shown on the DELAY TIME MULT dial. The next trigger after this point will start the delayed sweep. One purpose of the triggered mode is to eliminate jitter that may be present in highly magnified displays. Another purpose is to select the trigger starting the delayed sweep. For example, to view a low level signal impressed on a high level signal, trigger the main sweep on the high level signal and the delayed sweep

Fig. 1-2. Relationships of Main and Delayed sweeps.

on the low level signal. Select the portion to trigger the delayed sweep in the intensified mode. See Fig. 1-2B.

Press the SWP MAG button and notice the sweep speed increase by an order of magnitude. This is shown on the SEC/DIV dial and the CRT readout.

If the waveform viewed is line-frequency related, push the button labeled LINE in the light green TRIG SOURCE column. The signal activating the trigger circuits in this

mode is taken from the power line. External triggers may be applied to the EXT TRIG connector. Push the button labeled EXT in the light green TRIG SOURCE column.

External Horizontal Amplifier

To use the 5B42 as an amplifier, rotate the MAIN SEC/DIV switch fully CCW to the AMP position. Apply the calibrator waveform to the BNC connector marked EXT HORIZ AMPL. Two dots approximately eight divisions apart are visible. There is no front-panel gain adjustment for the external horizontal amplifier.

SPECIFICATIONS

All references to divisions or VOLTS/DIV refer to major graticule divisions in this manual.

Main Sweep

ACCURACY: (Measured in 5400 series oscilloscope over center 8 graticule divisions. Exclude the first 30 ns and the last 10 div of the magnified sweep):

	+15°C to +35°C		0°C to +50°C	
	Unmag	Mag	Unmag	Mag
1 s/div to 0.5 μs/div	3%	4%	4%	5.5%
5 s/div and 2 s/div 0.2 μs/div and 0.1 μs/div	4%	5%	5%	6.5%
Any two divisions within center 8 divisions	6.5%	6.5%	8%	8%

VARIABLE RANGE: Continuously variable between calibrated sweep rates. Extends sweep rate to at least 12.5 s/div.

TRIGGERING:

Coupling	Vertical Plug In Series	Freq. Range	Minimum Signal Required	
			Int.	Ext.
DC	5400	DC to 10 MHz	0.4 div	100 mV
		10 MHz to 60 MHz	1.0 div	400 mV
	5100	DC to 2 MHz	0.4 div	
AC		Requirements increase below 50 Hz.		
LF REJ		Requirements increase below 7.5 kHz.		

TRIGGER LEVEL RANGE: ≥8 div.

SINGLE SWEEP: Same requirements as main sweep.

EXTERNAL TRIGGER INPUT:

Maximum input voltage: 350 V DC + peak AC, 350 V P-P AC at ≤1 kHz.

Input R and C: 1 MΩ ±2% paralleled by ≈20 pF.

Trigger Level Range: ≥1.25 V.

Delayed Sweep

ACCURACY: (Measured in 5400 series oscilloscope over center 8 graticule divisions):

	+15°C to +35°C		0°C to +50°C	
	Unmag	Mag	Unmag	Mag
0.1 s/div to 0.5 μs/div	3%	4%	4%	5.5%
0.5 s/div and 0.2 s/div; 0.2 μs/div and 0.1 μs/div	4%	5%	5%	6.5%
Any two divisions within center 8 divisions	6.5%	6.5%	8%	8%

TRIGGERING:

DC to 10 MHz: 0.4 div.

60 MHz: 1 div.

EXTERNAL HORIZONTAL INPUT:

Deflection Factor: 50 mV/div ±3%.

Bandwidth:

DC Coupled: DC to ≥2 MHz.

AC Coupled: ≤50 Hz to ≥2 MHz.

Operating Instructions—5B42

Delaying Sweep Characteristics

DELAY TIME MULTIPLIER RANGE: 0.2 to 10 times the TIME/DIV setting.

INHERENT DELAY TO START OF DELAYED SWEEP: <100 ns.

DIFFERENTIAL TIME MEASUREMENT ACCURACY:

1 μ s/div to 0.5 s/div delay time: $\leq 1\% + 0.2\%$ of full scale.

1 s/div to 5 s/div delay time: $\leq 2\% + 0.2\%$ of full scale.

JITTER: ≤ 1 part in 20,000 of 10 times the main TIME/DIV setting.

THEORY OF OPERATION

Introduction

Refer to the complete schematic diagrams, and the block diagram, located in the pullout pages at the back of this manual, for a complete understanding of the 5B42 theory of operation.

External Horizontal Amplifier

Signals applied to the EXT HORIZ AMPL input, J10, are fed through a divide-by-two attenuator, consisting of R11, R15, and AC compensating capacitor, C15, to the gate of source follower Q20. When S10A is in the AC COUPL position, C11 AC couples the signal to Q20. The circuit DC balance is set by R25 through Q24. In the AMP mode, the signal travels past protective diodes CR30 and VR30 to Q34, an emitter follower. The emitter of Q34 drives the emitter of Q36, operating as an operational amplifier. The feedback path is through VR42, R45, R50, and R52. The latter sets the gain at two. The amplifier is disabled, when the MAIN SEC/DIV switch is not in the AMP position, by raising the common emitters to about +5 V. The output from the amplifier is the junction of VR42 and R45. Positioning in the external mode is accomplished by a section of the main POSITION control connected to the base of Q36 through R49.

External Trigger Channel Switch

The purpose of the trigger switches is to isolate the unwanted trigger source. They also provide gain. The output of Q20 feeds the base of Q60, whose emitter drives Q62 in a grounded-base configuration. The output of Q62 drives Q80 as a grounded-base amplifier. The base level of Q80 is set by CR80, R80, R83, and R85. To prevent coupling of the trigger signal through the switch, the emitters of Q60 and Q62 are disconnected from -15 V. The collector of Q62 rises toward +15 V as Q62 is turned off. Diode CR81 conducts, and causes a very low impedance to ground at the output of Q62. CR81 maintains the DC stability of the circuit, and shorts any capacity-coupled signal that may be present on the collector of Q62 to ground. C98 AC-couples the output of either Q80, Q90, or Q230 in the AC-coupled mode. C99 and R280 form a high pass RC combination for rejection of low frequency signals. Q90's base is connected to a secondary of the line transformer. A low level voltage at line frequency is obtained for line triggering. Q60, Q62, Q200, and Q210 are disabled in the line mode by removing the -15 V from their emitters.

Internal Trigger Channel Switching

These switches (Schematic 2) operate in the same manner as the switch described in the preceding paragraph. The trigger signal from the right vertical plug-in is applied to the base of Q100, through pin 4A on the rear interface connector. The left vertical plug-in trigger signal is applied through pin 4B to the base of Q150. The outputs of the right or left trigger switches are applied to the internal trigger channel switch, and then to the main trigger comparator (Schematic 3). CR235 holds the base of Q230 positive when the plug-in is operating in the external amplifier mode to prevent coupling of any trigger signals from either vertical plug-in to the external horizontal amplifier.

Main Trigger Comparator

This circuit selects the voltage level on the waveform where triggering takes place. The triggering signal is applied to the base of Q280. Q280 and Q290 serve as a voltage comparator. The DC level at the base of Q290 is set by R320, the MAIN TRIG LEVEL control. If the voltage at the base of Q280 is higher, current will flow through Q280 and the collector of Q290 will be high. The opposite is true if the base voltage of Q280 is lower, and the collector of Q290 will be low. C285 and R285 improve high frequency response. LR293, C293, LR299, and C299 prevent coupling of switching transients into the voltage supply lines.

Delayed Trigger Comparator

This comparator operates in the same manner as the Main Trigger Comparator. The input to the base of Q370 is selected from either the right or left trigger channel switch. It is not possible to trigger the delayed sweep externally.

Main Trigger Generator (SN B059999 and below)

This circuitry uses emitter-coupled logic. Significant high levels are approximately 4.2 V, and low levels 3.2 V. Low amplitude analog trigger signals may operate gates U320, U330A, U330B, and U335A. The remainder of the gates operate at digital levels exclusively.

Input to the main trigger generator is pin 7 of U320, an exclusive OR gate. Pushing the + SLOPE button sets a low on pin 9, which allows U320 to operate as a non-inverting amplifier with a gain of five. A positive-

Theory of Operation—5B42

going trigger signal at pin 10 of U320 causes a positive output from pin 14 of U335C which starts the sweep. U335B and C form a latch, which generates the sweep gate. When the sweep ends, the junction of R356 and R357 goes high, setting latch U330C and D so that a high is on pin 14 of U330C. This high resets latch U335B and C. In this state, U335C can not initiate a sweep gate. When the hold-off time passes, the junction of R356 and R357 goes low. A low at pin 6 of U330B, or the next negative-going trigger, causes latch U330C and D to reset, enabling latch U335B and C. The next positive output from U320 initiates the sweep gate by lowering pin 13 of U335C. When negative slope triggering is desired, a high is placed on pin 9 of U320, which allows U320 to operate as an inverting amplifier with a gain of five.

Main Trigger Generator (SN B060000 and up)

Integrated circuit U300 converts the trigger comparator output signal to a gate that is used for sweep control. With pin 1 connected to ground (+SLOPE), a positive-going signal on the input (pin 13) causes the output (pin 3) to rise to about 4.1 V. Pin 14 is negative-going under these conditions. The output gate occurs when a trigger signal passes through the hysteresis limits at the input of U300 (pin 13 is within 20 mV of pin 14). Placing pin 1 at +5 V (−SLOPE) creates an output gate at pin 3, when pin 13 is negative-going and pin 14 positive-going. After completion of the sweep, and during holdoff time, pins 6 and 10 are high (about +4.2 V). This action inhibits the trigger generator until these pins drop to about +3.2 V, which occurs after completion of holdoff time.

Delayed Trigger Generator (SN B059999 and below)

This generator operates, in the triggered mode, in the same manner as the main trigger generator. In the delayed sweep and intensified sweep modes, the delayed sweep starts when the junction of R438 and R440 goes low. The highs placed on pins 14 and 15 of U410, through diodes CR410 and CR411, cause a continuous low at pin 6 of U420B. This causes pin 12 of U425C to go low at the beginning of the delayed pickoff gate. Pin 9 of U425B is held high, causing a continuous low on pin 13 of U425C. Two lows at the inputs of U425C cause a high at pin 14 starting the delayed sweep runup.

Delayed Trigger Generator (SN B060000 and up)

In the Trig After Delay mode, this generator operates in the same manner as the Main Trigger Generator, U300. The delayed sweep starts when two conditions are met: the delay gate at pin 6 and 10 of U400 must be low (approximately +3.2 V), and a trigger signal must pass through the hysteresis limits at the input of U400 (i.e., pin 13 is within 20 mV of pin 14).

Sweep Control

U450, with additional external circuitry, controls the main sweep generator. In the automatic triggering mode, pin 19 of U450 is connected to ground. If pin 1 of U450 receives no trigger pulses from the main trigger generator for a period of time determined by R495 and C495, circuitry in U450 outputs a negative-going square wave. This negative-going square wave from pin 3 of U450, drives the base of Q480 negative. The collector goes positive and stays positive for the duration of the sweep. A positive pulse at the emitter of Q480, from the trigger switches, also causes the collector of Q480 to go positive, starting the sweep. This positive pulse is also applied to the unblanking circuitry, in the plug-in and the mainframe, to unblank the CRT during the sweep.

The sweep ramp is fed to the base of Q470, which forms a comparator with Q460. Q470 is conducting and Q460 is off. As the ramp rises, current flow in Q470 is reduced until CR460 is forward biased, and Q460 comes sharply into conduction. This positive pulse at pin 16 of U450 causes the auto gate (from pin 3) to go positive, terminating the sweep through Q480. If the unit is operating in the triggered mode, a positive gate appears at pin 17, lowering the sweep gate via the main trigger generator and Q480, terminating the sweep.

As the sweep ramp decays toward ground, Q460 and Q470 switch, so that pin 16 of U450 again goes low. No negative pulse can appear at pin 3 to start the next sweep. Pin 17 remains high, locking out the main trigger generator until holdoff time is completed. This time is determined by C500, R500, C501 and C502. These components are switched according to sweep rates, as shown in the switch details. Holdoff is necessary to allow all sweep-generating circuits to discharge before the start of the next sweep.

When the external horizontal amplifier mode is used, pin 18 of U450 is connected through CR455 to +5 V. This disables the sweep until the switch is opened.

In the single sweep mode, the automatic trigger capability is removed by ungrounding pin 19 of U450. Pin 12 is connected to +5 V. The next trigger operates the sweep in the normal manner. The gate at pin 17, however, remains high, locking out further triggers until pin 11 of U450 is grounded and pin 15 is connected to +5 V through the spring-loaded RESET button. VR490 and CR490 provide −5 V for U450.

Main Sweep Generator

The sweep ramp is generated in U550. The ramp is fed to the horizontal amplifiers and the sweep control from pin 8. Timing capacitors C_t and timing resistors R_t determine the rate of rise. The DELAY TIME MULT potentiometer

Theory of Operation—5B42

controls one half of a comparator in U550. The other half is connected internally to the ramp. When the ramp voltage reaches the voltage on the center arm of the delay time potentiometer, pin 4 of U550 goes high, driving the collector of Q570 low. This low gate starts the delayed sweep through the delayed trigger generator. A low at the collector of Q574 deactivates the delayed sweep by locking pin 4 of U550 in the low state. This occurs only when operating in the main sweep mode. When operating in other than the main sweep mode, pin 5 of U550 is high during main sweep time, allowing the delayed sweep to start at the selected time. Q540 aids in reducing sweep jitter, and R545 compensates for leakage current in U550.

Delayed Sweep Generator

The delayed sweep generator integrated circuit is identical to the one used in the main sweep. Several external connections are changed to suit the delayed sweep operating mode. Pin 5 of U600 is always connected to +5 V, enabling the generator whenever the plug-in has power applied. When the positive sweep gate from the delayed trigger generator is applied to pin 1, the sweep starts, and the CRT is unblanked through the emitter of Q690. The sweep runs up until the delayed trigger generator receives a positive-going pulse from Q570. The delayed sweep gate, at pin 1 of U600, goes negative, the CRT is blanked and the sweep decays. If the sweep time of the delayed sweep is much faster than the main sweep, the delayed sweep ramp will reach 10 V, its limit, before the gate at pin 1 returns the ramp to ground. The voltage at pin 6 is fixed at 10 V. As the ramp rises past 10 V (at the end of the sweep) pin 4 goes high, blanking the CRT through Q690. Under this condition, the CRT is blanked through the base of Q690 from pin 4 of U600, and the delayed sweep remains high until turned off by the delayed sweep gate.

Output Buffer

Main or delayed sweep ramps are applied to the base of Q650. Q650 and Q670 comprise an emitter-coupled paraphase buffer for the sweep ramp. In the magnified mode, emitter degeneration is reduced, resulting in an increase in gain by ten times. Clamping limits the peak-to-peak excursion at the collector of Q650 to about 1.2 V. Q665 is a constant current source. Sweep positioning is accomplished by varying current balance in the amplifier through the base of Q670.

When the plug-in is operated in the external amplifier mode, the base of Q680 is connected through R682 to +5 V. This saturates Q680 and eliminates the effect of the position control on the base of Q670. Positioning is accomplished in the external horizontal amplifier as described previously. The base of Q720 is made more positive through CR685 to unblank the CRT. Output from the external horizontal amplifier is connected to R672, and R672 is disconnected from ground.

The main sweep gate is applied at the base of Q730. CR732 conducts only when the emitter of Q730 goes negative at the end of the main sweep gate. This negative going pulse activates circuitry in the main frame to alternate traces in vertical plug-ins. When the CHOP pushbutton is in, pins 18A and 20A on the interface connector are connected together, causing the vertical plug-ins to operate in the chopped mode.

The main sweep gate, during sweep time, raises the base of Q720 through CR710. The collector is made more negative and the CRT is unblanked, during sweep time, through circuitry in the main frame. In the delayed sweep mode, the base of Q720 is held low, through CR712, preventing the CRT from unblanking by the main sweep gate. Q695 improves unblanking from the main sweep at the faster sweep speeds. CR690 and CR691 are protective diodes for Q690 and the internal circuitry of U600 connected to pin 1.

Readout

The DLY'D, MAIN SEC/DIV, CAL, DLY'D SWP, MAIN SWP, INTENS SWP, and MAG switches have contacts wired into the readout circuitry. A zero to -15 V pulse, approximately 125 μ s in length, is applied at different times to all of the rear interface connectors associated with the readout circuitry, except the two column and row lines. These are the output lines. The readout circuitry, in the 5B42, sets the correct amount of current, to the appropriate channel row and column lines during the pulse time, for the particular character desired. See the main-frame manual for more details on the time slot and current required for each character. Connecting the anode of CR970 to +5 V, in the AMP mode, disables both main and delayed sweep readouts. When the DLY'D SWP pushbutton is in, +5 V is connected to the anode of CR971. This disables the main sweep readout. When either the MAIN SWP or INTENS SWP pushbuttons are depressed, the delay sweep readout is inactivated via CR976. When the MAG button is depressed, two additional zeros are added to the readout showing the correct time per division for the active sweeps. When the CAL knob is not in its detent position, the uncalibrated sign (>) appears in the slot for the main sweep only. Diodes CR901 through CR933, connected to the time slot lines, decouple noise pulses generated in the main frame readout circuitry.

Timing Switch Details

Timing capacitors and resistors are connected according to the switching chart shown on Schematic 7. The CAL potentiometer varies the timing resistance in any position of the MAIN SEC/DIV switch. Lamps DS760 through DS766 illuminate the SEC/DIV knob skirts. The diodes in series with the lamps prevent series current from one lamp lighting another, in certain switch combinations.

SERVICE INFORMATION

Services Available

Tektronix, Inc. provides complete instrument repair and adjustment at local Field Service Centers and at the Factory Service Center. Contact your local Tektronix Field Office or Representative for further information.

Maintenance

Refer to the oscilloscope mainframe manual for general service information. The "A" Board is the board on the left when facing the front of the 5B42. The "B" Board is on the right. To remove the A circuit board, remove the ten pushbuttons on the front panel located in the light green TRIG SOURCE area by pulling straight out. Remove the pushrods connected to the +SLOPE, SINGL SWP, and RESET switches by separating the ends of the rods with a screwdriver. Unsolder the white and orange wire connected to the POSITION control and the coaxial cable connected to the EXT TRIG bnc connector. Loosen the 0.050 inch Allen screw on the CAL switch shaft, accessible through the hole in the A board, located as shown on the Controls, Connectors & Block Diagram pullout page. The knob must be in the CAL position. Remove the shaft by pulling the knob. Remove five screws on the A Board and four screws on the B Board, as shown on the Internal Adjustment Procedure pullout page. Fold the A Board back to gain access to the cam switches or other switches located between the boards.

Removal of the B Board will not usually be necessary, but may be accomplished by removing all leads soldered to the board. Remove the attached switch knobs and levers, and the three screws holding the board to the chassis.

Jumpers for the +5 V, +15 V, +30 V, -15 V, and -30 V supplies are located in the lower rear corner of the A Board. Remove these jumpers rather than the board interconnecting cable to isolate the A Board from the power supplies.

Repackaging for Shipment

If the Tektronix instrument is to be shipped to a Tektronix Service Center for service or repair, attach a tag showing: owner (with address) and the name of an individual at your firm that can be contacted, complete instrument serial number and a description of the service required.

Save and re-use the package in which your instrument was shipped. If the original packaging is unfit for use or not available, repackage the instrument as follows:

1. Obtain a carton of corrugated cardboard having inside dimensions of no less than six inches more than the instrument dimensions; this will allow for cushioning. Refer to the following table for carton test strength requirements.
2. Surround the instrument with polyethylene sheeting to protect the finish of the instrument.
3. Cushion the instrument on all sides by tightly packing dunnage or urethane foam between carton and instrument, allowing three inches on all sides.

SHIPPING CARTON TEST STRENGTH

Gross Weight (lb)	Carton Test Strength (lb)
0-10	200
10-30	275
30-120	375
120-140	500
140-160	600

Service Information—5B42

DIAGRAMS AND CIRCUIT BOARD ILLUSTRATIONS

Symbols and Reference Designators

Electrical components shown on the diagrams are in the following units unless noted otherwise:

- Capacitors = Values one or greater are in picofarads (pF).
Values less than one are in microfarads (μF).
- Resistors = Ohms (Ω).

Graphic symbols and class designation letters are based on ANSI Standard Y32.2-1975.

Logic symbology is based on ANSI Y32.14-1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

The overline on a signal name indicates that the signal performs its intended function when it goes to the low state.

Abbreviations are based on ANSI Y1.1-1972.

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

- Y14.15, 1966 Drafting Practices.
- Y14.2, 1973 Line Conventions and Lettering.
- Y10.5, 1968 Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

The following prefix letters are used as reference designators to identify components or assemblies on the diagrams.

A	Assembly, separable or repairable (circuit board, etc)	H	Heat dissipating device (heat sink, heat radiator, etc)	S	Switch or contactor
Ai	Attenuator, fixed or variable	HR	Heater	T	Transformer
B	Motor	HY	Hybrid circuit	TC	Thermocouple
BT	Battery	J	Connector, stationary portion	TP	Test point
C	Capacitor fixed or variable	K	Relay	U	Assembly, inseparable or non-repairable (integrated circuit, etc.)
CB	Circuit breaker	L	Inductor, fixed or variable	V	Electron tube
CR	Diode signal or rectifier	M	Meter	VR	Voltage regulator (zener diode, etc.)
DL	Delay line	P	Connector, moveable portion	W	Wirestrap or cable
DS	Indicating device (lamp)	Q	Transistor or silicon-controlled rectifier	Y	Crystal
E	Spark Gap, Ferrite bead	R	Resistor, fixed or variable	Z	Phase shifter
F	Fuse	RT	Thermistor		

The following special symbols may appear on the diagrams:

REPLACEABLE ELECTRICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

X000 Part first added at this serial number
00X Part removed after this serial number

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name Identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

ABBREVIATIONS

ACTR	ACTUATOR	PLSTC	PLASTIC
ASSY	ASSEMBLY	QTZ	QUARTZ
CAP	CAPACITOR	RECP	RECEPTACLE
CER	CERAMIC	RES	RESISTOR
CKT	CIRCUIT	RF	RADIO FREQUENCY
COMP	COMPOSITION	SEL	SELECTED
CONN	CONNECTOR	SEMICOND	SEMICONDUCTOR
ELECTLT	ELECTROLYTIC	SENS	SENSITIVE
ELEC	ELECTRICAL	VAR	VARIABLE
INCAND	INCANDESCENT	WW	WIREWOUND
LED	LIGHT EMITTING DIODE	XFMR	TRANSFORMER
NONWIFI	NON WIREWOUND	XTAL	CRYSTAL

Replaceable Electrical Parts—5B42

REPLACEABLE MECHANICAL PARTS

PARTS ORDERING INFORMATION

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

SPECIAL NOTES AND SYMBOLS

- X000 Part first added at this serial number
- 00X Part removed after this serial number

FIGURE AND INDEX NUMBERS

Items in this section are referenced by figure and index numbers to the illustrations.

INDENTATION SYSTEM

This mechanical parts list is indented to indicate item relationships. Following is an example of the indentation system used in the description column.

```

1 2 3 4 5           Name & Description
Assembly and/or Component
Attaching parts for Assembly and/or Component
-----
Detail Part of Assembly and/or Component
Attaching parts for Detail Part
-----
Parts of Detail Part
Attaching parts for Parts of Detail Part
-----
    
```

Attaching Parts always appear in the same indentation as the item it mounts, while the detail parts are indented to the right. Indented items are part of, and included with, the next higher indentation. The separation symbol --- * --- indicates the end of attaching parts.

Attaching parts must be purchased separately, unless otherwise specified.

ITEM NAME

In the Parts List, an Item Name is separated from the description by a colon (:). Because of space limitations, an Item Name may sometimes appear as incomplete. For further Item Name identification, the U.S. Federal Cataloging Handbook H6-1 can be utilized where possible.

INTERNAL ADJUSTMENT PROCEDURE

Test Equipment

For calibration, and a complete accuracy check of the 5B42, the following equipment is required:

Tektronix TG 501 Time Mark Generator (requires a TM 500-series power module).

Square Wave Generator capable of producing a 0.5 V, 1-kHz square wave with ≤ 20 ns risetime, Tektronix PG 506 Calibration Generator (requires a TM 500-series power module).

Tektronix 5400-series oscilloscope (provides power for 5B42).

Vertical Plug-In for the 5400-series oscilloscope, such as the 5A48 Dual Trace Amplifier.

Voltmeter, at least 20,000 Ω/V , or a test oscilloscope with 10X probe capable of accurately determining 0 V.

50 Ω Coaxial Cable with bnc connectors, Tektronix Part No. 012-0057-01.

Plug-In Extender, Tektronix Part No. 067-0645-03.

50 Ω feed through termination, Tektronix Part No. 011-0049-01 or equivalent.

Preparation

Remove the covers from the 5B42 and the cabinet panels from the 5400-series oscilloscope. Insert the 5B42 in the right hand plug-in compartment. Connect the plug-in extender to the left hand vertical plug-in interface connector, and connect the vertical plug-in to the extender. Make certain that the vertical plug-in is oriented properly: top of the plug-in to top of the extender, to top of the oscilloscope interface connector. Use of the extender on the vertical plug-in is necessary to gain access to adjustments on the A Board. See the Adjustments foldout page for the test point and adjustment locations. Make adjustments at an ambient temperature between +20°C and +30°C (+68°F and +86°F) for best accuracy.

1. Adjust External Horizontal Balance

Set the MAIN SEC/DIV switch to 1 m, and push the AUTO TRIG, EXT, and MAIN SWP buttons. All other buttons should be out. Obtain a visible free running trace that is vertically centered in the graticule area by adjusting the vertical and horizontal POSITION controls and the display module INTENSITY control. Using the 5B42 POSITION control, position the start of the trace at the extreme left vertical graticule line. Switch the MAIN SEC/DIV switch to the AMP position. Reduce the INTENSITY control, if necessary, to prevent burning the

phosphor. Move the spot horizontally to the graticule center by adjusting R25, Ext Hor Cent, located on the A Board.

2. Adjust External Horizontal Gain

Apply a 0.5 V, 1 kHz square wave from the square-wave generator through the coaxial cable to the EXT HORIZ AMPL connector. Adjust R52, Ext Hor Gain, located on the A Board for 10 divisions of horizontal deflection. Use the 5B42 POSITION control to position the dots to the extreme right and left vertical graticule lines while making this adjustment.

3. Adjust Input Attenuator Compensation

Connect a fast rise (≤ 20 ns) 0.5 V square wave through a terminated coaxial cable to the A INPUT connector.

Adjust C15, Att Comp, located on the A Board for minimum horizontal overshoot or undershoot on the two dots referred to in the previous step.

4. Adjust Main Sweep Offset

Connect the probe of a test oscilloscope (set for 50 mV/Div) or the positive lead of the voltmeter to TP545. Connect the negative lead to the 5B42 chassis. Adjust R545, Main Swp Offset on the A Board for a reading of 0 V.

5. Adjust 1 ms Timing

Connect the time mark generator to the vertical plug-in. Set the generator for 1 ms markers. Set the MAIN SEC/DIV switch to position 1 m, and push the LEFT TRIG SOURCE button. Obtain a stable display by adjusting the MAIN TRIG LEVEL knob. Make certain that the CAL knob is in the extreme clockwise detent position. Adjust R655, Lf Tim, on the B Board for a spacing of one time mark per vertical graticule line. Push the DLY'D SWP button. Check for a spacing of one marker per vertical graticule line, within specifications. Push the MAIN SWP button.

6. Adjust Fast Main Sweep Timing

Set the MAIN SEC/DIV switch to the 5 μ position. Apply 0.5 μ s markers to the vertical plug-in. Obtain a stable display. Adjust C550, Hf Tim, on the A Board for one time mark per vertical graticule line. Check the .2 μ and .1 μ positions of the MAIN SEC/DIV switch for one mark per vertical graticule line, within specifications. It may be necessary to go back to the 5 μ position and compromise the adjustment of C550 so that all three ranges are within specifications.

ADJUSTMENTS

7. Adjust Magnifier Gain

Change the MAIN SEC/DIV switch to position 1 m. Apply 0.1 ms markers to the vertical plug-in. Obtain a stable display. Center the trace horizontally in the graticule area. Press the SWP MAG button. Adjust R658, Mag Gain, located on the B Board for one time mark per vertical graticule line. Release the SWP MAG button.

8. Adjust Delayed Sweep Fast Timing

Push the DLY'D SWP button. Set the DLY'D SEC/DIV switch to the 5 μ position and the MAIN SEC/DIV switch to the 1 μ position. Apply 0.5 μ s markers to the vertical plug-in. Obtain a stable display by adjusting the MAIN TRIG LEVEL control. Set the DELAY TIME MULT dial fully CCW. Adjust C615, Hf Tim, on the B Board for one time mark per vertical graticule line.

9. Adjust Delay Sweep Start

Change the MAIN SEC/DIV dial to the 0.1 m position. Press the INTENS SWP button. Set the DLY'D SEC/DIV switch to the 10 μ position. Apply 0.1 ms markers to the vertical plug-in. Obtain a stable display by adjusting the MAIN TRIG LEVEL control. Check that the DELAY TIME MULT dial reads 0.2 in the fully CCW position. If not, loosen the Allen set screw and reset the dial. Adjust the intensity control so that the intensified portion of the sweep is clearly visible. Position the trace so that the trace starts on the extreme left graticule line. Set the DELAY TIME MULT dial to read 1.00. Adjust R530, Dly Strt, located on the B Board so that the intensified portion of the sweep starts on the second vertical graticule line from the left of the graticule. See Fig. 3-1A.

10. Adjust Delay Sweep Stop

Make certain that the INTENS SWP button is depressed. Turn the DELAY TIME MULT dial to read 9.00. Make certain that the trace starts at the extreme left graticule line. Adjust R522, Dly Stp, located on the B Board so that the intensified portion of the trace starts on the second vertical graticule line from the right of the graticule. See Fig. 3-1B. Go back to step 9 and repeat both steps until no interaction exists. To make the final adjustments, press the DLY'D SWP button. Adjust the delay start and stop potentiometers so that the time marks, visible at the start of the intensified portion in the intensified sweep mode, are just visible at the start of the trace in the delayed sweep mode. Fig. 3-1C shows the correct settings.

(A) Intensified portion set to 2nd time marker.

(B) Intensified portion set to 10th time marker.

(C) Typical display showing correct adjustment of R522 and R530.

Fig. 3-1. Delay Start and Stop adjustments.

BLOCK DIAGRAM 3EH 0273

CONTROLS AND CONNECTORS

1447-11

¹ Effective SN B090000 and up, the MAIN SEC/DIV-DLY'D SEC/DIV knob assembly is manufactured with a locking pin removed from the assembly (all instruments below SN B090000 use a locking pin). This pin removal allows the Delayed Sweep to operate at a slower sweep rate than the Main Sweep rate. Avoid this type of operation to prevent illogical displays, and always set the DLY'D SEC/DIV control for the same or a faster sweep rate than the MAIN SEC/DIV control.

5B42

PARTS LOCATION GRID

Components shown with dashed lines are located on back side of board.

A1-A circuit board (SN B059099 & below).

MANUAL CHANGE INFORMATION

At Tektronix, we continually strive to keep up with latest electronic developments by adding circuit and component improvements to our instruments as soon as they are developed and tested.

Sometimes, due to printing and shipping requirements, we can't get these changes immediately into printed manuals. Hence, your manual may contain new change information on following pages.

A single change may affect several sections. Since the change information sheets are carried in the manual until all changes are permanently entered, some duplication may occur. If no such change pages appear following this page, your manual is correct as printed.

SERVICE NOTE

Because of the universal parts procurement problem, some electrical parts in your instrument may be different from those described in the Replaceable Electrical Parts List. The parts used will in no way alter or compromise the performance or reliability of this instrument. They are installed when necessary to ensure prompt delivery to the customer. Order replacement parts from the Replaceable Electrical Parts List.

CALIBRATION TEST EQUIPMENT REPLACEMENT

Calibration Test Equipment Chart

This chart compares TM 500 product performance to that of older Tektronix equipment. Only those characteristics where significant specification differences occur, are listed. In some cases the new instrument may not be a total functional replacement. Additional support instrumentation may be needed or a change in calibration procedure may be necessary.

Comparison of Main Characteristics		
DM 501 replaces 7D13		
PG 501 replaces 107	PG 501 - Risettime less than 3.5 ns into 50 Ω.	107 - Risettime less than 3.0 ns into 50 Ω.
108	PG 501 - 5 V output pulse; 3.5 ns Risettime	108 - 10 V output pulse 1 ns Risettime
PG 502 replaces 107		
108	PG 502 - 5 V output	108 - 10 V output
111	PG 502 - Risettime less than 1 ns; 10 ns Pretrigger pulse delay	111 - Risettime 0.5 ns; 30 to 250 ns Pretrigger pulse delay
PG 508 replaces 114	Performance of replacement equipment is the same or better than equipment being replaced.	
115		
2101		
PG 506 replaces 106	PG 506 - Positive-going trigger output signal at least 1 V; High Amplitude output, 60 V.	106 - Positive and Negative-going trigger output signal, 50 ns and 1 V; High Amplitude output, 100 V.
067-0502-01	PG 506 - Does not have chopped feature.	0502-01 - Comparator output can be alternately chopped to a reference voltage.
SG 503 replaces 190, 190A, 190B	SG 503 - Amplitude range 5 mV to 5.5 V p-p.	190B - Amplitude range 40 mV to 10 V p-p.
191	SG 503 - Frequency range 250 kHz to 250 MHz.	0532-01 - Frequency range 65 MHz to 500 MHz.
067-0532-01		
SG 504 replaces 067-0532-01	SG 504 - Frequency range 245 MHz to 1050 MHz.	0532-01 - Frequency range 65 MHz to 500 MHz.
067-0650-00		
TG 501 replaces 180, 180A	TG 501 - Trigger output-slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	180A - Trigger pulses 1, 10, 100 Hz; 1, 10, and 100 kHz. Multiple time-marks can be generated simultaneously.
181	TG 501 - Trigger output-slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	181 - Multiple time-marks
184	TG 501 - Trigger output-slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	184 - Separate trigger pulses of 1 and 0.1 sec; 10, 1, and 0.1 ms; 10 and 1 μs.
2901	TG 501 - Trigger output-slaved to marker output from 5 sec through 100 ns. One time-mark can be generated at a time.	2901 - Separate trigger pulses, from 5 sec to 0.1 μs. Multiple time-marks can be generated simultaneously.

NOTE: All TM 500 generator outputs are short-proof. All TM 500 plug-in instruments require TM 500-Series Power Module.

REV B, JUN 1978

K4XL's  **BAMA**

This manual is provided **FREE OF CHARGE** from the "BoatAnchor Manual Archive" as a service to the Boatanchor community.

It was uploaded by someone who wanted to help you repair and maintain your equipment.

If you paid anyone other than BAMA for this manual, you paid someone who is making a profit from the free labor of others without asking their permission.

You may pass on copies of this manual to anyone who needs it. But do it without charge.

Thousands of files are available without charge from BAMA. Visit us at <http://bama.sbc.edu>
