Electronic Load Family

Agilent Technologies

PRINTING HISTORY

The manual printing date and part number indicate the current edition. Reprints between editions will have the same printing date and may include change pages with corrections or additions to be made to the manual by the user.

New editions of this manual will have a new printing date and, in some cases, may have a new part number. The new edition will include all changes and corrections made since the previous edition.

Update - April, 2000

Edition 3 - September, 1991

Edition 2 - August, 1989

Edition 1- December, 1988

SAFETY GUIDELINES

The beginning of the Electronic Load Operating Manual has a Safety Summary Page. Be sure that you are familiar with the information on that page before programming the electronic load for operation from a controller.

Table 1-1. GPIB Capabilities of Electronic Loads

GPIB Capabilities	Response	Interface Function
Talker/Listener	All electronic load functions except for setting the GPIB address are programmable over the GPIB. The electronic load can send and receive messages over the GPIB. Status information is sent using a serial poll. Front panel annunciators indicate the present GPIB state of the electronic load.	AH1, SH1, T6, L4
Service Request	The electronic load sets the SRQ line true if there is an enabled service request condition. Refer to <i>Chapter 5 - Status Reporting</i> for more information.	SR1
Remote/Local	In local mode, the electronic load is controlled from the front panel but will also execute commands sent over the GPIB. The electronic load powers up in local mode and remains in local mode until it receives a command over the GPIB. Once the electronic load is in remote mode the front panel RMT annunciator is on, all front panel keys (except Local) are disabled, and the display is in normal metering mode. Pressing Local on the front panel returns the electronic load to local mode. Local can be disabled using local lockout so that only the controller or the power switch can return the electronic load to local mode.	RL1
Device Trigger	The electronic load will respond to device trigger function.	DT1
Device Clear	The electronic load responds to the Device Clear (DCL) and Selected Device Clear (SDC) interface commands. They cause the electronic load to clear any activity that would prevent it from receiving and executing a new command (including *WAI and *OPC?). DCL and SDC do not change any programmed settings.	DCL, SDC

Figure 3-6. Batteries in Series

In this example, the Electronic Load is used to burn-in a power supply at its rated output current. Because the Electronic Load is operating in CC mode, if the power supply's output current drops below the rated output current during the test, the UNR (unregulated) condition will be set on the Electronic Load. This can be used to indicate that a failure has occurred on the power supply. If the unregulated condition persists for a specified time, the inputs of the Electronic Load are turned off.

The purpose of this example is not to illustrate power supply testing, but to explain how to program and use the status registers on the Electronic Load. The part of the program that runs the test simply monitors the supply at the rated output current for one hour and stops the test. You can replace this portion of the program with your own routine to test the power supply. Although SRQ (service request) is enabled to interrupt only on the UNR bit in this example, you can modify the program to interrupt on other conditions.

Figure 3-7. Typical Burn-In Test

Battery Test Example Program

```

470         STOP
480     END IF
490     RETURN
500     END

```

The present resistance level of each channel changes from the present level to the pending level on any of the following:

- On a **TRIG[:IMM]** command (always).
- On receipt of an external trigger signal (if **TRIG:SOUR** is set to **EXT**).
- On the next line voltage cycle (if **TRIG:SOUR** is set to **LINE**).
- On receipt of ***TRG** (unless **TRIG:SOUR** is set to **HOLD**).
- On receipt of a GPIB <GET> (if **TRIG:SOUR** is set to **BUS**).
- On the next trigger timer pulse (if multiple electronic load is set to **TRIG:SOUR TIM**).

The programmed resistance level (whether **IMM**ediate or **TRIG**gered) can be implicitly changed with a **RANG**e command (refer to *Chapter 3 - Introduction to Programming* for information concerning value coupling).

Command Syntax **RES**istance[:**LE**vel][:**IMM**ediate] <**NRf**+>
RESistance[:**LE**vel] :**TRIG**gered <**NRf**+ >

Parameters See Table 4-1 and the Operating Manual of the electronic load model.

Note The higher values of resistance levels have less resolution. Programmed levels are set to the nearest value obtainable by the hardware.

Status and Errors **TRIG**gered level commands affect bits in the **STAT**us **OPER**ating **COND**ition and **STAT**us **CHAN**nel **COND**ition registers (See *Chapter 5 - Status Reporting*). Programmed resistance values outside the value range generate an error (See Table 4-2 at the end of this chapter). The correct resistance range must be programmed before the resistance level is programmed. Note from the parameters that there is considerable overlap between the middle and high ranges, but *no overlap between the low and middle ranges*.

Value Coupling If **RES:RANG**e is set to a range that is *below* either type of **LE**vel, then that **LE**vel will assume the **MAX** value of that range.

Examples **RES 25** *Immediate commands for 25-ohm input*
RESISTANCE:LEVEL 25

RES:TRIG: .025 *Commands for 25 milliohm input on*
RESISTANCE:LEVEL:TRIGGERED 25E-3 *occurrence of a trigger*

RES:IMM .1;TRIG 1 *Set input to 100 milliohms now and to 1 ohm*
when trigger occurs

Query Syntax **RES?** **RES? MAX** **RES? MIN**
RES:TRIG? **RES:TRIG? MAX** **RES:TRIG? MIN**

Returned Parameters <**NR3**> **RES?** and **RES:TRIG?** return the presently programmed input resistance levels. After a trigger or **ABOR**t, **RES:TRIG?** returns the same value as **RES?**.
RES? MAX, **RES? MIN**, **RES:TRIG? MAX** and **RES:TRIG? MIN** return the maximum and minimum programmable **RES** and **RES:TRIG** values for the present range.

Related Commands **ABOR** **RES:RANG** **TRAN**sient Subsystem

The following command/queries are associated with this register group:

Command/Query Syntax

Register

STATus:OPERation:CONDition?	Returns the binary value of the Operation Status Condition register, which represents the present status. The condition is occurring whenever the bit is <i>1</i> .
STATus:OPERation:PTRansition	A filter that specifies whether or not a <i>0-to-1</i> transition in the Condition register will set the corresponding bit in the Event register. Program the bit position to <i>1</i> to enable the transition requirement.
STATus:OPERation:PTRansition?	Returns the binary value of the PTR ansition filter.
STATus:OPERation:NTRansition	A filter that specifies whether or not a <i>1-to-0</i> transition in the Condition register will set the corresponding bit in the Event register. Program the bit position to <i>1</i> to enable the transition requirement.
STATus:OPERation:NTRansition?	Returns the binary value of the NTR ansition filter.
STATus:OPERation[:EVENT]	Returns the binary value of the Operation Event register, which latches specified transition in the Operation Condition register the first time they occur. The event bit remains <i>1</i> even if the condition has since disappeared. <i>Reading this register resets it to 0.</i>
STATus:OPERation:ENABLE	A mask that specifies which bits of the Operation Status Event register are allowed to be summed into the OPER (Operation) bit of the Status Byte register. Set the bit to <i>1</i> to enable the corresponding condition. Program <i>MAX</i> to enable all allowable bits or <i>MIN</i> to disable them.
STATus:OPERation:ENABLE?	Returns the binary mask value of the Operation Status Enable register.

Note To specify a bit to be set on either a 0-to-1 or a 1-to-0 transition, program both filters (**NTR** and **PTR**) for that bit to *1*. To prevent a bit from being sent under any conditions, program that bit in both filters to *0*.

Returned Parameters <NR 1> Register binary value.

Examples **STAT:OPER?** Returns the binary value of the Operation Status Event register.

STAT:OPER:COND? Returns the status of the electronic load as it existed the instant the register was read.

STAT:OPER:PTR 32;NTR 32 Program a recorded event on any transition of the *WTG* bit.

Note **ABORt** can also cause a *WTG* bit event if the corresponding **NTR**ansition bit is set to *1*.

Related Commands/Queries **ABOR** ***CLS** **TRIG** ***TRG**

PULSe	A one-shot pulse that alternates between LEVel and TLEVel upon occurrence of an explicit trigger.
TOGGLE	Each explicit trigger causes the input to alternate between LEVel and TLEVel .

The input levels (**LEVel** and **TLEVel**) are programmed from the Current, Resistance, or Voltage Subsystems. So is **SLEW**, which determines the rate at which the input changes from one level to the other.

Note For a detailed description of transient subsystem operation, see *Operation Overview* in the Electronic Load *Operating Manual*.

Keywords

<i>Command</i>	<i>Function</i>
TRANsient[:STATe] ON 1	Enable Transient function.
TRANsient[:STATe] OFF 0	Disable Transient function.
TRANsient:MODE CONTInuous	Select continuous pulse train varying between LEVel and TLEVel at FREQuency .
TRANsient:MODE PULSe	Select single triggered pulses of duration TWIDth .
TRANsient:MODE TOGGLE	Select pulses that switch between LEVel and TLEVel on alternate triggers.
TRANsient:DCYCLE	Set pulse duty cycle of CONTInuous mode.
TRANsient:FREQuency	Set pulse frequency of CONTInuous mode.
TRANsient:TWIDth	Set pulse duration of PULSe mode.
Related Commands	LEVel <GET> *TRG SLEW TLEVel
Related Subsystem	TRIGger Subsystem

Table 4-2. Summary of Error Messages

Error Number	Error String (Description/Explanation/Examples)
-100	Command error [generic]
-101	Invalid character
-102	Syntax error [unrecognized command or data type]
-103	Invalid separator
-104	Data type error [e.g., "numeric or string expected, got block data"]
-105	GET not allowed
-108	Parameter not allowed [too many parameters]
-109	Missing parameter [too few parameters]
-112	Program mnemonic too long [maximum 12 characters]
-113	Undefined header [operation not allowed]
-121	Invalid character in number [includes "9" in octal data "#q", etc.]
-123	Exponent too large [numeric overflow; exponent magnitude >32 k]
-124	Too many digits [number too long; more than 255 digits received]
-128	Numeric data not allowed
-131	Invalid suffix [unrecognized units, or units not appropriate]
-138	Suffix not allowed
-141	Invalid character data [bad character, or unrecognized]
-144	Character data too long [maximum length is 12 characters]
-148	Character data not allowed
-150	String data error
-151	Invalid string data [e.g., END received before close quote]
-158	String data not allowed
-160	Block data error
-161	Invalid block data [e.g., END received before length satisfied]
-168	Block data not allowed
-170	Expression error
-171	Invalid expression [e.g., illegal character in expression]
-178	Expression data not allowed
-180	Macro error
-181	Invalid outside macro definition [e.g., '\$1' outside macro definition]
-183	Invalid inside macro definition
-200	Execution error [generic]
-220	Parameter error
-221	Settings conflict [uncoupled parameters]
-222	Data out of range [e.g., frequency too high for this instrument]
-223	Too much data [out of memory; block, string, or expression too long]
-240	Hardware error
-310	System error
-313	Calibration memory lost [out of cal due to memory failure]
-330	Self-test failed [more specific data after ";"]
-350	Too many errors [error queue overflow]
-400	Query error
-410	Query INTERRUPTED [query followed by DAB or GET before response complete]
-420	Query UNTERMINATED [addressed to talk, incomplete program message received]
-430	Query DEADLOCKED [input buffer and output buffer full; can't continue]
-440	Query UNTERMINATED after indefinite response [indefinite response request not the last request in message unit]

The Channel Status Enable register can be programmed to specify which channel status event bits are logically-ORed to become the corresponding channel bit in the Channel Summary Event register.

Manual Updates

The following updates have been made to this manual since the print revision indicated on the title page.

4/15/00

All references to HP have been changed to Agilent.

All references to HP-IB have been changed to GPIB.
