Specifications subject to change.

LeCroy

1. Warranty and Product Support

It is recommended that you thoroughly inspect the contents of the oscilloscope packaging immediately upon receipt. Check all contents against the packing list/invoice copy shipped with the instrument. Unless LeCroy is notified promptly of any missing or damaged item, responsibility for its replacement cannot be accepted. Contact your nearest LeCroy Customer Service Center or national distributor immediately (see chapter 2 for *contact numbers*).

1.1 Warranty

LeCroy warrants its oscilloscope products for normal use and operation within specifications for a period of three years from the date of shipment. Calibration each year is recommended to ensure in-spec. performance. Spares, replacement parts and repairs are warranted for 90 days. The instrument's firmware has been thoroughly tested and is thought to be functional, but is supplied without warranty of any kind covering detailed performance. Products not made by LeCroy are covered solely by the warranty of the original equipment manufacturer.

Under the LeCroy warranty, LeCroy will repair or, at its option, replace any product returned within the warranty period to a LeCroy authorized service center. However, this will be done only if the product is determined after examination by LeCroy to be defective due to workmanship or materials, and not to have been caused by misuse, neglect or accident, or by abnormal conditions or operation.

1.2 Product Assistance

Note: This warranty replaces all other warranties, expressed or implied, including but not limited to any implied warranty of merchantability, fitness, or adequacy for any particular purpose or use. LeCroy shall not be liable for any special, incidental, or consequential damages, whether in contract or otherwise. The client will be responsible for the transportation and insurance charges for the return of products to the service facility. LeCroy will return all products under warranty with transport prepaid.

Help on installation, calibration, and the use of LeCroy equipment is available from the LeCroy Customer Service Center in your country.

1.3 Maintenance Agreements

LeCroy provides a variety of customer support services under Maintenance Agreements. Such agreements give extended warranty and allow clients to budget maintenance costs after the initial three-year warranty has expired. Other services such as installation, training, enhancements and on-site repairs are available through special supplemental support agreements.

1.4 Staying Up to Date

LeCroy is dedicated to offering state-of-the-art instruments, by continually refining and improving the performance of LeCroy products. Because of the speed with which physical modifications may be implemented, this manual and related documentation may not agree in every detail with the products they describe. For

example, there might be small discrepancies in the values of components affecting pulse shape, timing or offset, and — infrequently — minor logic changes. However, be assured the scope itself is in full order and incorporates the most up-to-date circuitry. LeCroy frequently updates firmware and software during servicing to improve scope performance, free of charge during warranty. You will be kept informed of such changes, through new or revised manuals and other publications.

Nevertheless, you should retain this, the original manual, for future reference to your scope's unchanged hardware specifications.

1.5 Service and Repair

Please return products requiring maintenance to the Customer Service Department in your country or to an authorized service facility. The customer is responsible for transportation charges to the factory, whereas all in-warranty products will be returned to you with transportation prepaid. Outside the warranty period, you will need to provide us with a purchase order number before we can repair your LeCroy product. You will be billed for parts and labor related to the repair work, and for shipping.

1.6 How to return a Product

Contact the nearest LeCroy Service Center or office to find out where to return the product. All returned products should be identified by model and serial number. You should describe the defect or failure, and provide your name and contact number. In the case of a product returned to the factory, a Return Authorization Number (RAN) should be used.

Return shipments should be made prepaid. We cannot accept COD (Cash On Delivery) or Collect Return shipments. We recommend air-freighting.

It is important that the RAN be clearly shown on the outside of the shipping package for prompt redirection to the appropriate LeCroy department.

1.7 What Comes with Your Scope

The following items are shipped together with the standard configuration of this oscilloscope:

- Front Scope Cover
- 10:1 10 M Ω PP006 Passive Probe — *one per channel*
- Two 250 V Fuses, AC Power Cord and Plug
- *Operator's Manual, Remote Control Manual, Hands-On Guide*
- Performance Certificate or Calibration Certificate, Declaration of Conformity

Note: Wherever possible, please use the original shipping carton. If a substitute carton is used, it should be rigid and packed so that the product is surrounded by a minimum of four inches or 10 cm of shock-absorbent material.

minimum of four inches or 10 cm of shock-absorbent material.

2. General Information

2.1 Product Assistance

Help on installation, calibration, and the use of LeCroy equipment is available from your local LeCroy office, or from LeCroy's

- Customer Care Center, 700 Chestnut Ridge Road, Chestnut Ridge, New York 10977-6499, U.S.A., tel. (914) 578-6020
- European Service Center, 2, rue du Pré-de-la-Fontaine, 1217 Meyrin 1, Geneva Switzerland, tel. (41) 22/719 21 11.
- LeCroy Japan Corporation, Sasazuka Center Bldg – 6th floor, 1-6, 2-Chome, Sasazuka, Shibuya-ku, Tokyo Japan 151-0073, tel. (81) 3 3376 9400

2.2 Installation for Safe and Efficient Operation

Operating Environment

For safe operation of the instrument to its specifications, ensure that the operating environment is maintained within the following parameters:

Temperature 5 to 40 °C (41 to 104 °F) rated.

Humidity..... Maximum relative humidity 80 % RH (non-condensing) for temperatures up to 31 °C decreasing linearly to 50 % relative humidity at 40 °C

Altitude..... < 2000 m (6560 ft)

The oscilloscope has been qualified to the following EN61010-1 category:

Installation (Overvoltage) Category II

Protection Class..... I

Pollution Degree 2

Safety Symbols

Where the following symbols or indications appear on the instrument's front or rear panels, or elsewhere in this manual, they alert the user to an aspect of safety.

 **CAUTION:** Refer to accompanying documents (for Safety-related information). *See elsewhere in this manual wherever the symbol is present.*

 **CAUTION:** Risk of electric shock

 **On (Supply)**

 **Standby (Supply)**

 **Earth (Ground) Terminal**

 **Alternating Current Only**

 **Chassis Terminal**

 **Earth (Ground) Terminal on BNC Connectors**

WARNING Denotes a hazard. If a **WARNING** is indicated on the instrument do not proceed until its conditions are understood and met.

 **WARNING**

Any use of this instrument in a manner not specified by the manufacturer may impair the instrument's safety protection.

The oscilloscope has *not* been designed to make direct measurements on the human body. Users who connect a LeCroy oscilloscope directly to a person do so at their own risk. Use only indoors.

Power Requirements

The oscilloscope operates from a 100 V to 240V AC power source at 50 Hz to 60 Hz.

No voltage selection is required, since the instrument automatically adapts to the line voltage present.

Fuses

The power supply of the oscilloscope is protected against short-circuit and overload by means of two **6.3 A/250 V AC** "T"-rated fuses, located above the mains plug.

Disconnect the power cord before inspecting or replacing a fuse. Open the fuse box by inserting a small screwdriver under the plastic cover and prying it open. For continued fire protection at all line voltages, replace only with fuses of the specified type and rating (*see above*).

Ground

The oscilloscope has been designed to operate from a single-phase power source, with one of the current-carrying conductors (neutral conductor) at ground (earth) potential. Maintain the ground line to avoid an electric shock.

None of the current-carrying conductors may exceed 250 V rms with respect to ground potential. The oscilloscope is provided with a three-wire electrical cord containing a three-terminal polarized plug for mains voltage and safety ground connection. The plug's ground terminal is connected directly to the frame of the unit. For adequate protection against electrical hazard, this plug must be inserted into a mating outlet containing a safety ground contact.

Cleaning and Maintenance

Maintenance and repairs should be carried out exclusively by a LeCroy technician. Cleaning should be limited to the exterior of the instrument only, using a damp, soft cloth. Do not use chemicals or abrasive elements. Under no circumstances should moisture be allowed to penetrate the disk drive analyzer. To avoid electric shocks, disconnect the instrument from the power supply before cleaning.

CAUTION

Risk of electrical shock: No user-serviceable parts inside. Leave repair to qualified personnel.

Power On

Connect the oscilloscope to the power outlet and switch it on using the power On/Standby button, located near the left-hand corner of the instrument below the screen. After the instrument is switched on, auto-calibration is performed and a test of the disk drive analyzer's ADCs and memories is carried out. The full testing procedure takes approximately 10 seconds, after which time a display will appear on the screen.

3. Instrument Architecture Overview

PROCESSORS

The Waverunner central processor (CPU), a PowerPC™ microprocessor, performs the oscilloscope's computations and controls its operation. A range of peripheral interfaces allow you to control remotely, store waveforms and other data, and make hard copies. A support processor constantly monitors the front-panel controls. Waverunner either transfers data to display memory for direct waveform display, or stores it to reference memories, for fast data-processing.

ADCs

Each Waverunner channel has an eight-bit Analog-to-Digital Converter (ADC). The instrument's ADC architecture is designed to give excellent amplitude and phase correlation, maximum analog-to-digital conversion performance, large record lengths and superior time resolution.

MEMORIES

Waverunner acquisition memories simplify signal acquisition by producing waveform records that allow detailed analysis over large time intervals. There are four memories for temporary storage, and four more for waveform zooming and processing.

RIS

The Waverunner oscilloscope captures and stores repetitive signals at a maximum Random Interleaved Sampling (RIS) rate of 25 GS/s. This advanced digitizing technique enables measurement of repetitive signals with an effective sampling interval of 40 ps, and a measurement resolution of up to 5 ps.

TRIGGER SYSTEM

You can control Waverunner triggering to a highly specialized degree in accordance with waveform characteristics and chosen trigger conditions. The trigger source can be any of the input channels, line (synchronized to scope's main input supply) or external. The coupling is selected from AC, LF REJECT, HF REJECT, HF, and DC; the slope from positive and negative. Waverunner SMART Trigger offers a wide range of sophisticated trigger modes matched to special trigger conditions and sets of conditions.

AUTOMATIC CALIBRATION

Waverunner automatic calibration ensures an overall vertical accuracy of typically 1 % of full scale. Vertical gain and offset calibration, and horizontal (time) resolution take place each time you change the volts per division setting. Periodic and temperature-dependent auto-calibration ensures long-term stability at the current setting.

DISPLAY SYSTEM

You control the display's interactive, user-friendly interface using push-buttons and knobs. Display as many as eight different waveforms at once on eight separate grids. The parameters controlling signal capture are simultaneously reported. The Waverunner display presents internal status and measurement results, as well as operational, measurement, and waveform-analysis menus.

The 8.4-inch color flat-panel TFT-LCD screen presents waveforms and data using advanced color management. Overlap-mixing and contrast-enhancement functions ensure that overlapping waveforms remain distinct at all times. Both pre-set and personal color schemes are available.

The Analog Persistence function offers display attributes of an analog instrument with all the advantages of digital technology. The Full Screen function expands waveform grids to fill the entire screen.

A hard copy of the screen can be easily produced by pressing the front-panel PRINT SCREEN button.

INTERFACE AND PANEL SETUPS

Although Waverunner is a truly digital instrument, the front-panel layout and controls are similar to an analog oscilloscope's. Rapid response and instant representation of waveforms on the high-resolution screen add to this impression. Four front-panel setups can be stored internally and recalled either directly or by remote control, thus ensuring rapid front-panel configuration. When power is switched off, the current front-panel settings are automatically stored for subsequent recall at the next power-on.

REMOTE CONTROL

Waverunner has also been designed for remote control operation in automated testing and computer-aided measurement applications. You control the entire measurement process — including cursor and pulse-parameter settings, dynamic modification of front-panel settings, and display organization — through the rear-panel industry-standard GPIB (IEEE-488) and standard RS-232-C ports. See this manual's Chapter 12, *Use Waverunner with PC*, and the *Remote Control Manual*.

Specifications

MODELS

Waverunner LT342/322 Series: Two channels

Waverunner LT344 Series: Four channels

ACQUISITION SYSTEM

Bandwidth (- 3dB): LT342/LT344/LT322:500 MHz;LT224:200 MHz @ 50 Ω and at probe tip with PP006

Bandwidth Limiter at 25 MHz and 200 MHz can be selected for each channel **LT224 is 25MHz.**

Input Impedance: 50 Ω \pm 1.0 %; 1 M Ω \pm 1.0 % // 16 pF typical

Input Coupling: 1 M Ω : AC, DC, GND; 50 Ω : DC, GND

Max Input: 50 Ω : 5 Vrms; 1 M Ω : 400 V max (peak AC <-5 kHz + DC)

Single Shot Sampling Rate: 500 MS/s

Acquisition Memory: LT342/LT344;250 000 points per channel; 1 M points per channel on L models**LT224/LT322; 100 000**

Vertical Resolution: 8 bits

Sensitivity: 2 mV–10 V/div

Offset Range:

- 2 mV–99 mV/div: \pm 1 V
- 100 mV–0.99 mV/div: \pm 10 V
- 1 V–10 V/div: \pm 100 V

ACQUISITION MODES			
MODE	TIME BASE SETTING	MAXIMUM RATE	DESCRIPTION
Single Shot			
LT342(L)/LT344(L)	10 ns to 1000 s/div	500 MS/s	One ADC per channel
LT224/LT322	20 ns to 1000 s/div	200 MS/s	
Repetitive			
LT342(L)/LT344(L)	1 ns to 5 μ sec/div	25 GS/s	Random Interleaved Sampling (RIS)
LT224/LT322	1 ns to 10 μ sec/div	10 GS/s	
Sequence Mode			

LT342/LT344	2–1000 segments	500 MS/s	Stores Multiple Events with time stamp in segmented acquisition memories
LT224/LT322	2–400 segments	200 MS/s	Stores Multiple Events with time stamp in segmented acquisition memories
LT342L/LT344L	2–4000 segments	500 MS/s	Stores Multiple Events with time stamp in segmented acquisition memories
Roll Mode	$\leq 500\,000$ pts: 500 ms–1000s/div $\geq 500\,000$ pts: 1 s–1000s/div	100 ks/s	Waveform slowly rolls across display when used with slow time bases.

TIMEBASE SYSTEM

Timebases: Main and up to four zoom traces simultaneously

Time/Div Range: 1 ns/div to 1000 s/div

Clock Accuracy: ≤ 10 ppm

Interpolator Resolution: 5 ps

External Clock: ≤ 500 MHz, 50 Ω , or 1 M Ω impedance

TRIGGERING SYSTEM

Modes: NORMAL, AUTO, SINGLE and STOP

Sources: Any input channel, External, EXT 10 or line; slope, level and coupling are unique to each source (except line trigger)

Coupling Modes: DC(DC to 250MHz/LT224; DC to 200MHz), AC(Approx.7.5Hz to 250MHz/LT224; Approx.7.5Hz to 200MHz), HF(to 500MHz/LT224 not have), HFREJ, LFREJ (reject frequency 50 kHz typical)

Pre-Trigger Recording: 0–100 % of horizontal time scale

Post Trigger Delay: 0–10 000 divisions

Holdoff by Time or Events: Up to 20 s or from 1 to 99 999 999 events

Internal Trigger Range: ± 5 div

Maximum Trigger Frequency: Up to 500 MHz with HF coupling

External Trigger Input: ± 0.5 V, ± 5 V with Ext 10; max input same as input channels

SMART TRIGGER TYPES

Signal or pulse width: Triggers on glitches down to 2 ns(LT224 is 3ns). Pulse widths are selectable between < 2.5 ns to 20 s.

Signal interval: Triggers on intervals selectable between 10 ns and 20 s.

TV: Triggers on line (up to 1500) and field 1 or 2 (odd or even) for PAL (SECAM), NTSC, or non-standard video.

State/Edge qualified: Triggers on any input source only if a given state (or transition) has occurred on another source. Delay between sources is selectable by time or number of events.

Dropout: Triggers if the input signal drops out for longer than a selected time out between 25 ns and 20 s.

AUTOSETUP

Automatically sets timebase, trigger, and sensitivity to display a wide range of repetitive signals.

Vertical Find: Automatically sets sensitivity for the selected input signal

PROBES

Model PP006: PP006 with auto-detect: 10:1, 10 M Ω ; one probe per channel

Probe System: ProBus Intelligent Probe System supports active, high-voltage, current, and differential probes, and differential amplifiers

COLOR WAVEFORM DISPLAY

Type: Color 8.4-inch flat-panel TFT-LCD with VGA, 640 x 480 resolution

Screen Saver: Display blanks after 10 minutes

Real Time Clock: Date, hours, minutes, and seconds displayed with waveform

Number of Traces: Maximum eight on LT344/LT224 Series, six on LT342/LT322 Series; simultaneously display channel, zoom, memory, and math traces

Grid Styles: Single, Dual, Quad, Octal, XY, Single+XY, Dual+XY; Full Screen gives enlarged view of each style

Waveform Display Styles: Sample dots joined or dots only — regular or bold

ANALOG PERSISTENCE DISPLAY

Analog Persistence and Color Graded Persistence: Variable saturation levels; stores each trace's persistence data in memory

Trace Display: Opaque or transparent overlap

ZOOM EXPANSION TRACES

Style: Display up to four zoom traces

Vertical Zoom: Up to 5x expansion, 50x with averaging

Horizontal Zoom: Expand to 2 pts/div, magnify to 50 000x

Autoscroll: Automatically scan and display a captured signal

RAPID SIGNAL PROCESSING

Processor: Power PC 603e™

LT342/LT322	LT344/LT224	LT342L	LT344L
2.1.1 16 Mbytes	2.1.2 16 Mbytes	2.1.3 32 Mbytes	2.1.4 32 Mbytes
64 MBYTE SYSTEM MEMORY OPTIONAL FOR ALL MODELS			

INTERNAL WAVEFORM MEMORY

Waveform: M1, M2, M3, M4; memory length equal to acquisition memory

Zoom and Math: A, B, C, D; memory length equal to acquisition memory

Memories M1–4 and A–D store full-length waveforms with 16 bits/data point

SETUP STORAGE

For front panel and instrument status: Four non-volatile memories and floppy drive are standard; hard drive and memory card are optional

MATH TOOLS

Simultaneously perform up to four math processing functions; traces can be chained together to perform math on math. Standard functions: add, subtract, multiply, divide, negate, identity, summation, averaging to 1000 sweeps, ERES low-pass digital filters for 11-bit vertical resolution, FFT of 50 kpoint waveforms, Extrema for displaying envelope roof and floor, physical units, rescale (with units), sin x/x, resample (deskew).

MEASURE TOOLS

Cursor Measurements:

- **Relative Time:** Two arrow-style cursors measure time and voltage differences relative to each other with a resolution of ± 0.05 % full scale.
- **Relative Amplitude (Voltage):** Two horizontal bars measure voltage differences at ± 0.2 % fs resolution.
- **Absolute Time:** Cross-hair marker measures time relative to trigger and voltage with respect to ground.
- **Absolute Amplitude (Voltage):** A horizontal reference line cursor measures voltage with respect to ground.

Automated Measurements: Display any five parameters together with their average, high, low and standard deviations.

Pass/Fail: Test any five parameters against selectable thresholds. Limit testing is performed using masks created on the scope or on a PC. Setup a pass or fail condition to initiate actions such as hardcopy output, save waveform to memory, GPIB SRQ, or pulse out.

EXTENDED MATH AND MEASUREMENTS OPTION

Adds math and advanced measurements for general-purpose applications. Math Tools is expanded to include all standard math plus integration, derivative, log and exponential (base e and base 10), square, square root, absolute value, plus data log when using the trend function.

WAVEANALYZER OPTION

Adds math processing to include FFTs of 1 Mpoint waveforms, power spectrum density, spectrum averaging, waveform averaging to one million sweeps, continuous averaging, waveform histograms, and histogram parameters. Includes the Extended Math and Measurement option.

SPECIAL APPLICATION SOLUTIONS

Jitter and Timing Analysis (JTA): Precision cycle-to-cycle timing measurements with enhanced accuracy, histograms on persistence traces, persistence to waveform tracing and full statistical analysis.

PowerMeasureä : A complete solution for the power conversion engineer. Includes timing deskew of voltage and current, and rescale to electrical units.

INTERFACE

Remote Control: Full control via GPIB and RS-232-C

Floppy Drive: Internal, DOS-format, 3.5" high-density

PC Card Slot: Supports memory and hard drive cards

External Monitor Port: 15-pin D-Type VGA-compatible

Centronics Port: Parallel printer interface

Internal graphics printer (optional): 25 mm/s max, 112 mm paper width; provides hardcopy output in <10 seconds

OUTPUTS

Calibrator signal: 500 Hz–1 MHz square wave, –1.0 to +1.0, test point, and ground lug on front panel

Control signals: Choice of trigger ready, trigger out, or Pass/Fail status; TTL levels into 1 M Ω at rear panel BNC (output resistance 300 $\Omega \pm 10\%$)

GENERAL

Operating Conditions: Temperature 5–40° C; humidity 80 % non-condensing at 40° C; altitude \leq 2000 m

Shock and Vibration: Conforms to MIL-PRF-28800P; Class C

Power Requirements: 90–132 V AC and 180–250 V AC; 45–66 Hz; maximum power dissipation 150 VA–230 VA, depending on model

Certifications: CE, UL and cUL

Dimensions (HWD): 210 mm x 350 mm x 300 mm (8.3" x 13.8" x 11.8"); height excludes scope feet

Weight: 8 kg (18 lbs)

Warranty and Calibration: Three years; calibration recommended yearly

4. Theory of Operation

4.1 Processor Board

MPC603e Processor

The PowerPC603e on the processor board is a 4-bit RISC processor having 2x32Kbyte cache and features high speed processing and quick memory access.

The processor is designed to operate with an internal clock which is several times the external bus clock cycles and is used under the 32bit mode.

The board consists of two circuit-blocks:

- The 32bit block, that contains the main PowerPC processor, dynamic RAM modules, VGA interface, Super-I/O and main board interface.
- The 8bit block, which incorporates all peripherals and other interfaces for outer connections.

These two circuit-blocks are connected through MC68150 (dynamic bus sizer).

Power Supply

The board requires two power sources (Vcc and +12V). +12V source is used for OP-amp and small-peripheral operation.

The processor requires 3.3V, and all other logic devices are operated by the +5V source. All of the signals are TTL compatible.

The processor allows +5V input signals and does not require logic level conversion. An OP-amp and MOSFET transistor consist of 3.3V power source. The reference voltage is taken through the voltage-resistor divider network across +5V power source.

32bit Peripherals

There are six devices hooked on the processor's 32bit data bus:

- VGA video controller
- DRAM system
- bus sizer, an interface to 8bit circuit-block
- DMA controller
- Super-I/O
- MAIN board

CPU's Block Diagram

DRAM

The DRAM circuit consists of one or two SIMM modules, constituting from 16MB to a maximum of 128 MB. The SIMM modules to be supported are only of EDO types. The DRAM control circuit is built with one piece each of CPLD and GAL, and several gate ICs.

The DRAMC (IC13) located on the main control circuit, generates all types of bus cycle timing(normal R/W, 2-beat/8-beat bursts of R/W), refresh cycles, and DMA cycles. It also generates signals for automatic increment of column-addresses to be used in burst transfer mode. Furthermore, the DRAMC has a register for setting one or two SIMMs and determining SIMM size (whether it is less than 32MB or more than 64MB), in order to adjust the memory mapping so as not to have gaps in memory mapping according with the memory capacity.

The CAS (IC14) distributes signals for column address selection to the CAS signal circuits of each SIMM chip. CAS is selected by the size of memory access (1, 2, 3, and 4 bytes), accessing start-address, and type of bus cycles (normal, burst, refresh and DMA).

Two multiplexers (IC9 and IC10) switch the address lines of odd and even addresses to be connected with the address lines of each SIMM. The other multiplexer (IC11) switches low order address bits, i.e., routing them either directly to the processor or to the low order address generated in DRAMC.

Normal Access Timing

This is the simplest access possible: the processor puts an address onto the address bus and reads or writes the required data out of or to the DRAM which corresponds with the bus.

The bus width is 32bits, or 4bytes wide, and the CPU performs to read or write operations (of one through four bytes) which are chained in a bus cycle.

Burst Access Timing

A burst access, on the 603e configured with 32bit device operation, performs either two or eight successive reads in DRAM (2-beat or 8-beat burst access). The idea is to put the beginning of an address onto the address bus and read/write data out of or to DRAM every clock cycle, without incrementing the address required by the processor (this is to be achieved by the external logic circuit). Using EDO-DRAM enables to read and write every 30ns of clocks similarly as with one or two SIMMs. The 8-beat access is indicated by an active "low" of NTBST signals and a 32bit access signal (SIZ2..0=011), and the 2-beat access is indicated by an active "high" of NTBST signals and an access size of 64 bits (SIZ2..0=100).

Refresh Timing

The 32 KHz clock from the RTC chip is used to generate the timing to refresh DRAM. Without this clock, the DRAM would not be refreshed and all the data in it would be erased out. DRAMC detects the rising edge and the falling edge of this 32KHz clock. At the each edge, it generates the CAS before RAS refreshes the cycles.

The arbitration logics between other accesses (bus cycle with the processor and DMA cycle) and refresh cycles reside in the DRAMC.

DMA Timing

The DMA access can be used for data transfer to and from floppy disks.

The data is transferred in between the I/O and DRAMs by simultaneously accessing the desired addresses in the Super I/O and DRAMs.

The addresses A0 to A25 (as well as lower addresses up to 64MB on the memory map) can be accessed through the DMA controller. Since the Super I/O is directly connected to its 8bit to 32bit bus without passing through the bus sizer, data transfer can be done only to and from memory areas in which addresses are divided by intervals of 4bytes each.

Memory Mapping

When the main switch is on, the internal software automatically sets the system's memory size to the largest capacity available with the SIMM mounted (2 pieces of 128 MB SIMM size). It also checks whether all the addresses are perennial or not to prevent having "holes" in the address space. Through this operation, available memory capacity in the SIMM mounted is correctly judged and the capacity information is stored again into the DRAMC register. Thus, all the address spaces are assured for perennial address continuation.

VGA controller

The VGA controller chip 65545(IC29) contains the logic circuits to decode its own addresses. It generates all the video signals (RGB, H/V, and all control lines to drive the flat panel), and controls its associated 1 MB video DRAM (to read, write and refresh).

The total of video DRAMs mounted are two pieces of 2MB (but 512KB each of the DRAM only are used).

All timings are extracted from the 16MHz bus clock; therefore, no external crystal or time-base is required. The horizontal and vertical synchronization signals are sent to the external video connector (a half pitch, D-SUB15 pin connector is used).

The 65545 chip can support several bus interfaces (PCI, ISA, VL, etc), the system employs it for VL-bus applications with the mode of 256-color palette operations. The controller has an 18bit color palette and can display 256 colors out of the available 260,000. However, the liquid crystal panel can only use 12-bit color data, and color display is limited to 256 out of 4,096 colors (the color data will be extended to 18bits in the future).

The power supply circuit for the liquid crystal panel has a MOSFET switch that turns the power for the LCD with the reset signal, since the LCD needs to minimize its start-up time.

Super-I/O

This device controls RS-232Cs, floppy disks, and parallel port operations. The controller has its own time-base with a 24MHz crystal. RS-232C can be used by simply connecting the MAX232 buffer (IC31) to it. Since the Super I/O chip has a 16-byte buffer, high speed data transfer is easily carried out.

A 2HD disk drive can be directly connected to the system without any external components other than a piece of pull-up resistor; it can be operated in either interruption mode or DMA mode.

The parallel interface is also activated without other external components other than a piece of pull-up resistor, for the use of 2-way communication.

This IC chip has an IDE interface function in it, but this board does not support the function.

Bus Control

The DEC32 (IC17) performs decoding operations for the circuits (32bit circuit block) which are directly connected to the processor (except the DRAM). (The DRAMC performs decoding operations for the DRAMs).

The RW32 (IC76) generates the control signals of read/write for the devices associated with the DMA, and the byte enable signals (NBE0-3) for the VGA controller.

When the bus cycle starts, 603e must terminate the bus cycle by returning signals after acknowledging each of the data and addresses, from the outside. The ACK32 (IC19) is used to generate the acknowledgement signals.

The ARBT (IC18) has logics for arbitration between the DMA and processor accessing, and performs forced termination of the bus operation when the bus cycle can not be finished within a defined time.

The ACK8 (IC21) has logics for generation of the acknowledgement signals and read write strobe signals in the 8bit peripheral circuit block.

The DEC8 (IC22) has logics for decoding 8bit peripheral circuits, and a certain circuit involved in the address latch operation.

Bus Sizer

The MPC603e processor does not support dynamic bus sizing, which is performed with the 68K processor family. Each 8bit of a 32bit bus is fixed or assigned with the lower addresses, or 0 through 3 bits. Therefore, if an 8bit device were directly connected to the bus, this device would be seen in 4byte steps each in the memory map area. To avoid this, the 8bit-bus peripheral unit shall be connected to the 32bit-bus through the bus sizer, MC68150 (IC15). The bus sizer divides one bus cycle for accessing 32 bit-bus of the processor into four cycles each of 8bit accessing cycle, and/or assigns 8bit-bus data to a corresponding 8bits within the 32bits.

8bit Peripherals

The following devices are listed as 8bit data bus units:

- PCMCIA Interface
- Flash PROM
- NVRAM
- RTC
- Interrupt Controller
- GPIB Interface
- Small-peripherals Interface
- Internal printer Interface
- Front-Panel I/F
- Other registers and ports

PCMCIA, type I/II/III interface

This interface consists mainly of buffers for both data and address busses.

The CARD (IC71) generates the control signals both for memory card mode and I/O card mode.

The IC65 (D-F/F) holds control bits for the signals resetting the card, switching between the data area and the attribute area, and switching the card's modes. All bits in the register are reset to zero when the _RESET signal goes to active low,

which means that their state is also guaranteed at power-up.

The IC66 and the IC67 invert the most significant address bits of the memory card whenever the SWAP jumper is plugged in, so that the first bytes are always allocated to “FFF00000”, regardless of the size of the memory card. This allows to boot directly from the PCMCIA memory card used.

Flash PROM

Two pieces of the Intel's 29F008-compatible 1MB PROMs (IC45 and 46) are used to operate in the 8-bit bus mode. These ICs do not require any programming voltage to write.

From a hardware point of view, a flash PROM is regarded the same as an EPROM in read mode.

To erase or write to memory, commands are written into the data bus. Writing and erasing must be performed over monitoring the status-signals (RY/#BY) on the port (IC49).

The program may be seen to start from the Flash PROM. The Flash PROM is, however, not regarded as the program or its program area even when start-up (even when the screen appears) is completed, because the program must be processed in the DRAM after transferring the program content from the Flash PROM into the DRAM.

NVRAM

This memory chip is powered from the VCCO in the RTC. When the main power is set to off, the required power for the NVRAM is fed through the lithium battery installed. When the power is set to on, it is powered from the VCC.

The #CS1 signals are also controlled through the RTC. When the main power is set to off, the RTC sets the chip select to the “high” level through a pull-up resistor to place the SRAM a power-down mode to prevent any accidental overwriting.

RTC

The DS1689 real time clock has several functions:

- Keeping the time-of-day and current-date information while power is off.
- Generating 32KHz clock for DRAM refreshment.
- Giving 128Hz of periodic interrupt signals to force bus accessing from the processor and allowing periodic updating of the time display.
- Providing a unique ID that identifies the origination of scope ID.
- Feeding the power and the chip select signal to the NVRAM.

The chip generates timing clocks necessary for time keeping and driving all other circuits by connecting to 32.768KHz crystal. A few discrete components around it leave the chip powered, when the system is set to off, by the backup lithium battery while the rest of the board is not powered, and charge the battery when the power is on again.

Accesses from the processor are done through the circuit for the bus separation, for addresses and data are multiplexed.

The unique ID was already written in the RTC by the manufacturer, since every different value must be stored in each chip.

Interrupt Controller

In order to prioritize and control several interrupt sources, it is necessary to use an IC of uPD71059. It scans eight interrupt signals and sends a unique interrupt signal to the processor when an (unmasked) interrupt signal appears. Interrupt levels are assigned as follows:

level 0	(lowest priority) FDC
level 1	small peripherals
level 2	RS232C
level 3	GP-IB
level 4	PCMCIA(I/O card mode)
level 5	real time clock
level 6	the MAIN board
level 7	(highest priority) unused

The priority in the above can be changed by the software.

Small Peripheral Interface

This 8-bit interface is intended to allow external expansion of the board in addition to the processor board.

The tri-state buffers drive the address and control lines, and bi-directional buffers drive data lines.

The address decoding is processed on each expanded peripheral board. Since the acknowledgement toward each access is also returned by the expanded board, there is no restriction to the amount of wait-states.

The bus clock runs at 16MHz, and a reset line reinitializes the boards as does in the CPU.

Four interrupt lines are also included in this interface, so that interrupt-driven boards can be used.

Front Panel

The front panel is accessed by serial read/write signals passing through the IC47 and IC48.

The CPU board can be reset by resetting the 3 buttons on the front panel. This function becomes effective by setting a bit of IC52 for enabling.

Both LED and BEEP are activated by serial writing. LED and BEEP are initialized off by the resetting operation.

Reset Circuit

The power supply is monitored by the IC4 chip. Whenever the Vcc goes below 4.5V (even for a very short time), a reset pulse, in which the width is determined by the C6's capacity, is generated.

Resetting 3 buttons on the front panel also causes to generate the reset pulse as did in the IC4 when the supply power voltage fell too low.

Bus Error Generation

The 603e expects NTA and NAACK signals for the acknowledgement to the current bus cycle, and inserts wait states during the period NTA and NAACK are kept at "high" levels (any of external devices have not caused to lower the levels). As long as any of the devices does not return the acknowledgement, the bus is to be kept forever in this wait-condition. Then, an external circuit may be required to generate a bus-error signal to break the pending cycle after a given time-out.

The bus error is generated by pulling the NTEA pin of the CPU down to "low". This is the job done by the GAL (ARBT:IC18) which counts the number of wait-states that have already passed through the counter (IC25). An external 8bit counter (IC18) extends the count to 128 wait-cycles with the 8MHz clock (125ns x128 =16us) before triggering the bus error. With this operation, the system can successfully force the terminate of the current cycle.

Some devices, such as the VGA video controller, have their own logic to generate bus error. Therefore, any access operation for such devices is not entirely related to this circuit.

GPIB Interface

The NEC 7210-compatible device, NAT7210, is employed as the controller, and the TI's conventional drivers, 75160 and 75161, are also used as the receivers.

Internal Printer Interface

Printer control is the same as for the normal Centronics interface. This circuit consists of buffers only.

Relation of I/O Structure to the associated GALs and CPLDs

The following block-diagram describes the flow in the decoder and the relationships between the acknowledgement to be returned to the CPU and GALs/CPLDs. Three-line boxes are GALs and CPLDs, and one-line boxes indicate other ICs and function blocks.

- DEC32 is the main decoder that performs the decoding operation for five devices. In this operation, however, decoding of the DRAM is excluded.
- DRAMC performs decoding of the DRAM and controls all access operations.
- CAS selects memory chips in the SIMMs according to sizes and addresses of DMA accessing.
- DEC8 is the main decoder in the 8bit-bus area, and does the decoding for three devices.
- CARD generates control signals to access PCMCIA.
- ACK32 generates ACK signals which inform the processor of the completion of bus cycle. The signals are made from the defined time after accessing each device or from the acknowledgement signal which is returned by each device.
- ACK8 informs the termination of the bus which completed within the defined time

after accessing 8bit devices. Regarding the PCMCIA and small peripherals, however, the termination can be delayed by giving an external wait signal.

The GALs which are not shown in this block-diagram are the ARBT and RW32.

- ARBT does the bus arbitration during the DMA's execution. It also generates a bus error when the bus cycle passes over the defined time.
- RW32 controls both the RW signals when the DMA is executed and the byte-enabled signals for the VGA controller.

Block Diagram representing relations between I/O Decoding and Acknowledgement

4.2 Main Board

Introduction

The main board is divided into the following sections:

- Front End
- A/D Converter & Memory
- Trigger
- Timebase
- DC Generator
- Calibrator & Internal Calibration signal
- Signal output
- Main Board Control

4.2.1 Front End

The front end processes an analog signal for ADC and trigger, consists of High impedance buffer, amplifier HFE428, and trigger comparator HTR420.

The main functions of the Front end without the amplifier HFE428 and HTR420 are:

- Four channels operation, calibration with Software control.
- Input protection (clamp + thermal detection) and coupling (AC, DC, 1M Ω , 50 Ω).
- Attenuator by 10 & by 100.
- Offset control.
- Offset control of $\pm 1V$ and CAL control of $\pm 1.4V$.
- Detection of 50 Ω over loading.
- Input of signal for calibration.

The main functions of HFE428 are:

Amplitude normalization for the ADC system : at the BNC the dynamic range is 16 mV to 80V FS (full scale) and the ADC/TRIG system input is 500 mV differential.

Fine adjustment of gain and variable control

Band width limiter of 25MHz, 200MHz

Main function of HFE420 are:

Generation of trigger signal (analog input and digital output) with comparator

Setting of trigger level (TRIG,VALIDATE)

Setting of trigger coupling (DC,AC,LFREJ,HFREJ,HF)

Setting of slope (+,-,WINDOW)

Block diagram 1

Control

Relay control

The relay of the attenuator is set by selecting the input coupling and the gain as shown in the table below.

RL1, 2 and 5 are driven with +5V/0V, and RL3, 4 is driven with +5V/-5V.

Input coupling

Control port	Relay	GND	1M,DC	1M,AC	50,DC
GND/*MES	RL2	H	L	L	L
1M/*50	RL1	H	H	H	L
AC/*DC	RL5	H	L	H	L
1/*10	RL3	H	X	X	X
1/*100	RL4	L	X	X	X

Switch of attenuator

Control port	Relay	2mV-99mV	100mV-0.99V	1V-10V
1/*10	RL3	H	L	L
1/*100	RL4	H	H	L

Divide gain

The gain ratio in each block and input range is a table below.

At the BNC the dynamic range is 16 mV to 80V FS (full scale) and the output is 500 mV differential (HAD626 input).

Block	Range V/div											
	2mV	5mV	10mV	20mV	50mV	100mV	200mV	500mV	1V	2V	5V	10V
ATT 1/*10	1	1	1	1	1	0.1	0.1	0.1	0.1	0.1	0.1	0.1
ATT 1/*100	1	1	1	1	1	1	1	1	0.1	0.1	0.1	0.1
HFE428	31.25	12.5	6.25	3.125	1.25	6.25	3.125	1.25	6.25	3.125	1.25	0.625
Total(ratio)	31.25	12.5	6.25	3.125	1.25	0.625	0.3125	0.125	0.0625	0.03125	0.0125	0.00625

Analog control voltage

Circuit name	signal level	Signal name
CHx OFFSET	+/-4V	Offset control signal
CHx GAIN	0 to +4V	HFE428 gain control signal
CHx TRIG LVL1	+/-4V	Trigger level control signal
CHx TRIG LVL2	+/-4V	Trigger level control signal for smart trigger/window
CHx HYST	0 to +4V	Trigger hysteresis control signal
INT CAL	0 to +600mV	Signal each CH commonness for calibration

Over load detection

When the input impedance is set to 50 ohm, the over load is detected because of the protection of the terminating resistance.

Over load signal CHx OVLD is produced by detecting temperature of resistance, xR85 for the load and xR87 for ambient.

It is necessary to measure a standard value when there is no input signal in order to detect the over load accurately.

The over load is detected by monitoring the difference between this standard value and

CHX OVLD.

Calibration

The front end executes the calibration of GAIN, BALANCE when the panel setups and the ambient temperature change, so guarantees the accuracy.

Block figure 2 shows the supply of the reference voltage INT CAL.

The calibration executes with INT CAL of standard DC voltage.

The INT CAL is all CH common signal and standard DC voltage of the maximum +/- 600mV.

The INT CAL is attenuated to 1/10 in +/-60mV or less.

The CAL OUT signal of DC-1MHz is independent with an internal calibration. The signal can be monitored with an external terminal by switching the internal calibration signal.

Block diagram 2

4.2.2 A/D Converter & Memory

Introduction

The analog to digital converter system does the signal conversion to 8bit, using the following circuits:

HAD626

Chip on board MCM (Multi Chip Module).

Hybrid Acquisition Module containing both track & hold amplifier and 8bit ADC.

Differential signal input. (Nominal 500mVpp full scale.)

Differential ECL clock input. (up to 500M S/s.)

Differential ECL compatible data outputs and memory clock.

ECL compatible serial interface for internal ADC gain and offset control.

HMM436

Chip on board MCM.

Hybrid Memory Module containing MAM424.

Maximum buffer length is up to maximum 1Mbytes per channel.

MAM424 (Monolithic Access Memory) captures 8bit data at maximum rate of 500Mbytes/s.

Internal memory consists of a 2Mbit SRAM. (up to 250kbytes per channel.)

HMM436 (LTXXX) : one MAM424 per channel.

HMM436L (LTXXXL): four MAM424's per channel.

Parallel interface for reading data and writing registers.

4.2.3 Trigger

Introduction

The trigger system includes the following circuits:

HTR420

Chip on board MCM.

Hybrid TRigger module designed for a trigger conditioning in DSO.

Differential signal input. (Nominal 500mVpp full scale.)

Dual threshold inputs controlled by DC generator output.

Selectable filtering of input signal. (DC, AC, HF REJ, LF REJ)

Frequency divider by four. (HF)

Dual differential ECL outputs. (Trigger signal and qualifier signal)

Single ended analog output for TV trigger.

Serial interface for the internal settings.

TV trigger

This circuit is able to trigger on different TV line number standards.

TV trigger uses a commercial chip (LM1881).

LM1881 generates composite sync output, vertical sync output and odd/even output.

MST412(Edge qualified function) triggers on video signal using the outputs of LM1881.

LINE trigger

This circuit makes LINE trigger signal from AC line signal of Power Board.

Polarity of line trigger.

MST412

Trigger functions (Standard trigger, Hold off, Pulse width, Interval, State qualified, Edge qualified, Drop out) are made in Monolithic Smart Trigger.

Dual differential ECL inputs. (Trigger signal and qualifier signal)

Differential ECL clock input.

Differential ECL trigger output.

Parallel interface for writing registers.

400MHz OSC

generates the 400MHz clock for MST412.

ECL single ended output.

The clock frequency of oscillator is adjustable by analog signal from 8bit DAC.

The clock stops for Standard trigger, Hold off by events, TV trigger and LINE trigger.

TRIGGER Block Diagram

4.2.4 Timebase

Introduction

The timebase system includes the following three circuits:

MTB411A

Monolithic Time Base has five main sections:

TIMEBASE comprises five counters and associated logic circuitry for the timebase system.

TDC consists of two counters for interpolated and real computation.

TRIGGER is made up of two counters to be used by trigger circuitry.

FREQUENCY is made up of one counter to be used by the main oscillator circuitry.

DIVIDER consists of a bunch of dividers with multiplexer for probe calibration pulse.

Parallel interface for reading data and writing resistor.

MCG426

Monolithic Clock Generator.

generates sampling clock for sample & hold up to 500MHz (2GHz).

generates different clocks for MTB411A.

generates MCLR (Master CLeaR) to reset clock divider of HAD626.

generates RAMPST (RAMP STart) signal for Time to Digital Converter.

generates TRT (Test Real Time clock) signal to calibrate 400MHz clock for MST412.

implements divider and phase detector of a PLL to generate clock system at 2GHz.

Parallel interface for reading data and writing resistor.

Time to Digital Converter

measures the time (0 to 2ns) between the trigger and sampling clock using MTB411A.

The circuit magnifies the time by nominal two thousand times.

The magnifying power is adjustable by analog signal from 8bit DAC.

The magnified time is counted by MTB411A using 100MHz clock.

TIMEBASE Block Diagram

4.2.5 DC Generator

Introduction

DC generator includes the following circuits:

DC Generator

generates analog signals to control Front End offset, HFE428 gain, HTR420 threshold levels and the other circuits.

8bit microprocessor controls DC generator system.

DC generator uses a commercial 16bit DAC (DAC712).

Nominal +/-400mV full scale.

Gain and offset of output are adjusted by analog signals from 8bit DAC.

Analog to Digital Converter

converts analog input signals into digital data.(to detect 50 ohm input overload and to determine probe type.)

The conversion system consists of 16bit DAC and comparator.

4.2.6 Calibrator & Internal Calibration Signal

Introduction

generates the probe calibrator signal and internal calibration signal.

Probe calibrator

Continuous gain control using DC generator output, -1.0V to +1.0V.

Frequency control using MTB411A's divider, DC or 500Hz to 1MHz.

Internal calibration signal

Reference voltage signal for internal calibration.

High accuracy, low drift, low noise.

Nominal +/-600mV or +/-60mV output.

The block diagram is included by DC Generator block diagram.

4.2.7 Signal Output

Introduction

This circuit generates TTL signal for the output of rear panel.

The output signal is selected from trigger ready signal, triggered signal and PASS/FAIL signal.

The block diagram is included by DC Generator block diagram.

4.2.8 Main Board Control

Introduction

The Main Board Control includes the following circuits:

Main Board ACK signal generator

generates ACKnowledge signal for a communication between Main Board and CPU Board.

HMM436 control

generates special signals for access to HMM436.

generates clock signals for following components:
MTB411A (16MHz)
IIC BUS chip (8MHz)
8bit microprocessor of DC Generator (4MHz)

MCG426 control

generates special signals for access to MCG426.
generates *ATTenuator ENable signal to protect 50ohm input during power-up.

MST412 control

generates special signals for writing commands to MST412.

Serial I/F control

generates the following serial interface signals.
MB SRDI : serial data signal for components except Front End, HAD626 and HTR420.
MB SRCLK : serial clock signal for components except Front End, HAD626 and HTR420.
DCG SRCLK : serial clock signal for 8bit microprocessor of DC generator.
FE SRDI : serial data signal for Front End, HAD626 and HTR420.
FE SRCLK : serial clock signal for Front End, HAD626 and HTR420.
XXXX LD : load signal for serial interface components.

IIC-BUS control

controls Pro-Bus system via serial IIC-bus.
uses a commercial chip (PCF8584).
PCF8584 serves as an interface between parallel bus and the serial IIC-bus.

Thermometer

measures temperature of Main Board.
Acquired data are used to determine condition of internal calibration.

EEPROM

4kbit EEPROM.
stores main board calibration data.

8bit D/A Converter

generates analog signal to control trigger hysteresis, TDC gain, clock frequency for MST412,
and DAC adjustment of DC generator.
uses a commercial chip (MB88346).
MB88346 is 8bit 12channels DAC with output buffers.
Analog signal outputs are 0 to +4.0V full scale.

Main Board Data Read

reads Main Board data for a communication between Main Board and CPU Board.

DC GENERATOR Block Diagram

MAIN BOARD CONTROL Block Diagram

4.3 OUTLINE OF WAVERUNNER POWER SUPPLY

Input voltages :Wide ranges of inputs, 90~132 V AC and 180~250 V AC (45~66 Hz) are allowed.

Output voltages: 9 different DC voltages available.

+5 V	(DIG)
+12 V	(DIG)
+12 V	(FAN)
+24 V	(PRINTER)
-4.5 V	(DIG)
+5 V	(ANA)
+12 V	(ANA)
- 5 V	(ANA)
-12 V	(ANA)

This power unit consists of, roughly divided, five independent switching power supplies and two other circuits.

1. Input circuit (noise filters and rectifiers are included)
2. Harmonic-current correction power supply
By employing a step-up converter system, the input current waveform is controlled to be similar to the waveform of input voltage. The control unit is a PFC unit made with IC1. The output voltage is regulated to +377 V DC.
3. Auxiliary power supply (to feed the power for the Harmonic-current control power supply in the above 2).
Uses an RCC type converter, and outputs +20 V DC.
4. Main power supply-A
Uses a flyback converter, and outputs -4.5 V DC (DIG), ± 5 V DC (ANA), and ± 12 V DC (ANA) respectively. The output of -4.5 V DC is regulated, but the other outputs are not regulated and may fluctuate a little in the voltages depending on the load conditions.
5. Main power supply-B
Uses a flyback converter, and outputs are +5 V DC (DIG), +12 V DC (DIG), and +24 V DC (DIG), respectively. The outputs of +5 V DC and +12 V DC are regulated, but the output of +24 V DC may largely fluctuate according to the load conditions.
6. Auxiliary power supply (to feed the power for both Main power supplies- A and - B).
Uses an RCC converter, and outputs are +22 V DC and +27 V DC.
7. Series regulator.
Stabilizes the outputs of the main power source of ± 5 V DC (ANA), ± 12 V DC (ANA), and reduces the level of ripple noises.

The power switch is located on the secondary side (not the primary side) in order to switch-on and -off of the outputs at the secondary side; the whole control is made by switching on and off of the current control oscillator which is configured with the IC 2 and IC6. Although the power switch is placed to its off position, therefore, the power is being fed to all the components in the power supply units (stand-by mode), as long as the waverunner supply is connected to the AC outlet.

The above switching-on and -off function is actually made by shorting and opening of pins 6 and 7 of "CN3" in the power unit.

Since the design of this waverunner power supply is made based on the use of

forced air cooling with the fan-motors, operating the power supply for long hours by removing the upper and bottom covers would cause tripping of the overheat protection circuit because of a temperature rise in the unit, and result in the cease of power output.

The DC outputs are all guarded by the overload-current protection circuits; therefore, output short circuiting will not cause any damage to the equipment even it takes place. However, when the short-circuited state continues for long hours, the power output switch may cause open due to a possible temperature rise in several circuits, causing the excess-current protecting circuit to activate.

Releasing of the overheat protection circuit from its activated mode must not be made within the time less than five seconds by disconnecting the AC inlet plug out of the AC receptacle.

Do not touch any electric parts inside the power supplies during operation as the primary side of the power unit has many portions of over 500 Vrms of magnitudes to grounding.

< Operation of the parts inside the Waverunner Power Supply >

Circuit No. 1 / 7

The fuse, F1, heat-breaks to shut down the input when an abnormal excess-current keeps running through the input circuit. Replacing of the fuse must be made after locating the problem area and fixing failure parts (including damages).

The coils, L2, L3, L4, and L5, and capacitors, C1, C2, C3, C4, C5, C6, C94, and C105, configure the circuits of noise filters to the AC power lines.

The resistor, R2, which contains a thermo-fuse, is to limit the in-rush current when it flows into the input circuit. In case an abnormal input current keeps flowing, even when the power switch(through switching operation) is placed to off, the thermo-fuse melts down and disconnects the input circuit.

When the switching power supplies operate normally, the TRIAC, D2, turns on to bypass the R2 current, to reduce R2's electric losses during the operation.

The diode, D4, is a bridge circuit and is used for direct full wave rectification of the AC input.

Circuit No. 2 / 7

The IC1 in the PFC unit receives its operating power from the auxiliary power supply which consists of the transistor Q2 and transformer T1, etc; outputs the driving signals (Gate Signals) for the transistor Q1, and operates the Harmonic control power supply which consists of the choking coil L6, diode D5, capacitors C13, etc., to obtain the output of +377 V DC.

The variable resistor, R16, is to adjust the output voltage of +377 V DC in the Harmonic control power source.

#Circuit No. 3 / 7

The variable resistor, R117, is to adjust the output voltage of -4.5 V DC.

Circuit No. 4 / 7

The outputs of ± 5 V DC (ANA) and ± 12 V DC (ANA) use the series regulator, consisting of the transistors Q10 to Q18 and IC9, which stabilizes the output voltage and reduces the ripple voltages. Also, the series regulator performs the remote sensing function (by using No. 2 to No. 5 pins of Connector CN3) in order to keep the voltage of the main-board on the load side constant.

The variable resistor, R152, is for controlling the DC output voltages of ± 5 V (ANA) and ± 12 V (ANA). The DC output voltages of ± 5 V (ANA) and ± 12 V (ANA) are the tracking outputs (voltages of 4 outputs vary with each other).

Circuit No. 5 / 7

The variable resistor, R73, is used to adjust the regulated output voltage of +5 V DC (DIG).

#Circuit No. 6 / 7

The posistor, R 33, shows high resistance property when its temperature increases over 90°C (due to the temperature rises in Q10 or Q12), and stops IC2 and IC6 oscillations, causing disconnection of the voltage output circuits (through activation of the overheat protection circuit). Releasing of the overheat protection circuit from its activated mode must be made by confirming the heat-sink temperature of the protection circuit to be cooled under 80°C , by leaving the unit more than five seconds while the AC inlet plug out of the AC receptacle is disconnected.

The posistor, R160, becomes high resistance when its temperature increases over 80°C (due to the temperature rises in Q14 or Q16), and stops IC2 and IC6 oscillations, causing disconnection of the voltage output circuits (through activation of the overheat protection circuit). Releasing of the overheat protection circuit from its activated mode must be made by confirming the heat-sink temperature of the protection circuit to be cooled under 70°C , by leaving the unit more than five seconds while the AC inlet plug out of the AC receptacle is disconnected.

The posistor, R166, becomes high resistance when the temperature of R 166 increases over 110°C due to the temperature rise in Q1, and stops IC2 and IC6 oscillations which cause disconnection of the voltage output circuits (through activation of the overheat protection circuit). Releasing of the overheat protection circuit from its activated mode must be made by confirming the heat-sink temperature of the protection circuit to be cooled under 100°C , by leaving the unit more than five seconds while the AC inlet plug out of the AC receptacle is disconnected.

Circuit No. 7 / 7

The IC2 in the circuit of the switching power control ICs receives the power which is fed by the auxiliary power supply (circuit No.6/7) consisting of the transistor Q4 and the transformer T2, to output the driving signals (Gate signals) for the transistor Q6 (circuit No.5/7); and drives the Main power supply-A (circuit No.5/7) consisting of the

transformer T3 and others. The Main power supply-A generates the output voltages of +5 V DC (for DIG Circuit), +12 V DC (for DIG Circuit and Fan), and +24 V DC (for Printer), respectively.

The IC6 in the circuit of the switching power control ICs receives the power which is fed by the auxiliary power supply (circuit No.6/7) consisting of the transistor Q4 and the transformer T2, to output the driving signals (Gate signals) for the transistor Q8 (circuit No.3/7); and drives the Main power supply-B (circuit No.3/7) consisting of the transformer T4 and others. The Main power supply-B generates the output voltages of ± 5 V DC (for ANA circuit), ± 12 V DC (for ANA circuit), and -4.5V DC (for DIG circuit).

BLOCK DIAGRAM of FND POWER SUPPLY

5. Performance Verification

5.1 Introduction

This chapter contains procedures suitable for determining if the LT **Series** Digital Storage Oscilloscope performs correctly and as warranted. They check all the characteristics listed in subsection 5.1.1.

Because they require time and suitable test equipment, you may not need to perform all of these procedures, depending on what you want to accomplish.

In the absence of the computer automated calibration system based on LeCroy Calibration Software (LeCalsoft), this manual performance verification procedure can be followed to establish a traceable calibration.

It is the calibrating entities' responsibility to ensure that all laboratory standards used to perform this procedure are operating within their specifications and traceable to required standards if a traceable calibration certificate is to be issued for the LT **Series** Digital Storage Oscilloscope.

5.1.1 List of Tested Characteristics

This subsection lists the characteristics that are tested in terms of quantifiable performance limits.

- Input Impedance
- Leakage Current
- Noise
- DC Gain Accuracy
- Offset Accuracy
- Bandwidth
- Trigger Level
- Smart Trigger
- Time Base Accuracy
- Overshoot and Rise Time
- Overload

5.1.2 Calibration Cycle

The LT **Series** Digital Storage Oscilloscope requires periodic verification of performance. Under normal use (2,000 hours of use per year) and environmental conditions, this instrument should be calibrated once a year.

5.2 Test Equipment Required

These procedures use external, traceable signal generators, DC precision power supply, step generator and digital multimeter, to directly check specifications.

Instrument	Specifications	Recommended
Signal Generator Radio Frequency	Frequency : .5 MHz to 2 GHz Frequency Accuracy : 1 PPM	HP8648B or equivalent
Signal Generator Audio Frequency	Frequency : 0 to 5 kHz Amplitude : 8 V peak to peak	LeCroy LW420 or HP33120A or equivalent
Voltage Generator DC Power Supply	Range of 0 to 20 V, in steps of no more than 15 mV	HP6633A or equivalent
Step Generator Fast Pulser	Rise time 350ps \pm 100 ps Overshoot 3.5 % \pm 1 %	LeCroy 4969A + PB049 or equivalent
Power Meter + Sensor	Accuracy \pm 1 %	HP437B + 8482A or equivalent
Digital Multimeter Volt & Ohm	Voltmeter Accuracy : 0.1 % Ohmmeter Accuracy : 0.1 %	Keithley 2000 or equivalent
Adapter	50 Ω to 1M Ω	LeCroy 4962-9
Coaxial Cable, 1 ns	50 Ω , BNC, length 20 cm,	LeCroy 480232001
Coaxial Cable, 5 ns	50 Ω , BNC, length 100 cm,	LeCroy 480020101
2 Attenuators, 20 dB	50 Ω , BNC, 1 % accuracy	LeCroy 402200402
Attenuator, 6 dB	50 Ω , BNC, 1 % accuracy	LeCroy 402600403
Terminator, 2 W	50 Ω , BNC, Feed-Through	LeCroy 402323001
T adapter	50 Ω , BNC T adapter	LeCroy 402222002

Table 5-1 : Test Equipment

5.2.1 Test Records

The last pages of this document contain LT **Series** test records in the format tables. Keep them as masters and use a photocopy for each calibration.

5.3 Turn On

If you are not familiar with operating the LT **Series**, read the operator's manual.

- Switch on the power using the power switch.
- Wait for about 20 minutes for the scope to reach a stable operating temperature, and verify

5.3.1 PNL Files

- Use PNL Files depend on the LT344,LT342,LT322,LT224.
- The LTxxx shows one of the LT344,LT342,LT322,LT224.

5.4 Input Impedance

The impedance values for 50 Ω and 1M Ω couplings are measured with a high precision digital multimeter. The DMM is connected to the DSO in 4 wire configuration (input and sense), allowing for accurate measurements.

Specifications & Test limits

DC 1.00 M Ω ± 1 %
AC 1.20 M Ω ± 1 % (2mV/div to 99mV/div)
1.00 M Ω ± 1 % (100mV/div to 10V/div)
DC 50 Ω ± 1 %

5.4.1 Channel Input Impedance

a. DC 1MW

- Recall **LTxxxP001.PNL** or configure the DSO :

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels Trace OFF	:	Channel 1, Channel 2, Channel 3 & Channel 4
Input Coupling	:	DC 1MW on all 4 Channels
Input gain	:	50 mV/div. on all 4 Channels
Time base	:	50 nsec/div.
Trigger mode	:	Auto

26-Jan-99
10:53:35

- Set the DMM with **Ohms and Ohms sense** to provide a 4 wire measurement.
- Connect it to Channel 1.
- Measure the **input impedance**. Record it in Table 2, and compare it to the limits.
- Repeat the above test for all input channels.
- Recall **LTxxxP002.PNL** or Set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels.
- Record the measurements in Table 2, and compare the test results to the limits in the test record.

b. AC 1MW

- Recall **LTxxxP003.PNL** or configure the DSO as shown in 5.4.1.a, and for each Channel make the following change :

Input Coupling : **AC 1MW**

26-Jan-99
11:01:41

- For all input channels measure the **input impedance**.
- Record the input impedance in Table 2, and compare it to the limits.
- Recall **LTxxxP004.PNL** or Set Input gain to **200 mV/div** on all 4 Channels.
- Repeat the test for all input channels.
- Record the measurements in Table 2, and compare the results to the limits in the test record.

c. DC 50W

- Recall **LTxxxP005.PNL** or configure the DSO as shown in 5.4.1.a, and for each Channel make the following change:

Input Coupling : **DC 50W**

26-Jan-99
11:04:17

- For all input Channels, measure the input impedance.
- Record the **input impedance** in Table 2, and compare it to the limits.
- Recall **LTxxxP006.PNL** or set Input gain to **200 mV/div.** on all 4 Channels
- Repeat the test for all input channels. Record the measurements in Table 2, and compare the results to the limits in the test record.

5.4.2 External Trigger Input Impedance

a. DC 1MW

- Recall **LTxxxP007.PNL** or configure the DSO :

Trigger mode : **Auto**
 Select Setup trigger
 Trigger on : **EXT**
 Cplg Ext : **DC**
 External : **DC 1MW**
 Time base : **50 nsec/div.**

26-Jan-99
11:08:17

- Connect the DMM to External, and measure the **input impedance**.
- Record the input impedance in Table 2, and compare it to the limits.
- Recall **LTxxxP008.PNL** or set trigger to Ext/10
- Measure the **input impedance**.
- Record the test result in Table 2, and compare the result to the limits in the test record.

b. DC 50W

- Recall **LTxxxP009.PNL** or configure the DSO :

Select Setup trigger

Trigger on : **EXT**

External : **DC 50W**

26-Jan-99
11:11:15

AUTO

- Connect the DMM to External, and measure the **input impedance**.
- Record the input impedance in Table 2, and compare the result to the limit in the test record.

5.5 Leakage Current

The leakage current is tested by measuring the voltage across the input channel.

Test limit

DC 1MΩ : ±1 mV

5.5.1 Channel Leakage Current

- Recall **LTxxxP010.PNL** or configure the DSO :

Panel Setups : **Recall FROM DEFAULT SETUP**
 Channels Trace ON : **Channel 1, Channel 2, Channel 3 & Channel 4**
 Input Coupling : **DC 1MΩ** on all 4 Channels
 Input gain : **50 mV/div.** on all 4 Channels
 Trigger mode : **Auto**
 Time base : **10 msec/div.**

- Set the DMM to measure Volts, and connect it to Channel 1.
- Measure the **voltage** and enter it in Table 3. Compare it to the limits.
- Repeat the test for all input channels.

5.5.2 External Trigger Leakage Current

a. DC 50W

- Recall **LTxxxP011.PNL** or configure the DSO as shown in 5.5.1 and make the following changes :

Select Setup trigger
Set Trigger on : **EXT**

External : **DC 50W**

- Connect the DMM to External.
- Measure the **voltage** and enter it in Table 3. Compare it to the limits.

5.6 Noise

Noise tests with open inputs are executed on all channels for both 1M Ω and 50 Ω input impedance, with AC and DC input coupling, 0 mV offset, at a gain setting of 5mV/div., and different Time base settings.

The scope parameters functions are used to measure the RMS amplitude.

5.6.1 Rms Noise

Test limits

1 % of full scale or 0.4 mV rms at 5 mV/div.

Procedure

a. DC 1MW

With no signal connected to the inputs

- Recall **LTxxxP012.PNL** or configure the DSO :

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels Trace ON	:	Channel 1, Channel 2, Channel 3 & Channel 4
Input Coupling	:	DC 1MW on all 4 Channels
Input gain	:	5 mV/div. on all 4 Channels
Trigger setup	:	Edge
Trigger on	:	1
Coupling 1	:	DC
Trigger Mode	:	Auto
Time base	:	20 msec/div.
Channel use	:	4
Record up to	:	50 k Samples
Press	:	MEASURE TOOLS
Measure	:	Parameters

Statistics	:	On
Change parameters	:	
Category	:	All
On line 1	:	Measure sdev of Ch1
On line 2	:	Measure sdev of Ch2
On line 3	:	Measure sdev of Ch3
On line 4	:	Measure sdev of Ch4
On line 5	:	no parameter selected for line 5

- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high sdev** parameter values in Table 4, and compare the test results to the limits in the test record.
- Repeat the test for Time base : **1 msec/div.**, **50 msec/div.**, and **2 msec/div.**
- Record the measurements (high sdev of 1,2,3,4) in Table 4, and compare the results to the limits in the test record.

b. AC 1MW

- Recall **LTxxxP013.PNL** or configure the DSO as shown in 5.6.1 and for each Channel make the following change :

Input Coupling : **AC 1MW** on all 4 Channels

Time base : **2 msec/div.**

- Press **Clear Sweeps**.
- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.

- Record the four **high sdev** parameter values in Table 4, and compare the test results to the limits in the test record.

c. DC 50W

- Recall **LTxxxP014.PNL** or configure the DSO as shown in 5.6.1 and make the following changes :

Input Coupling : **DC 50W** on all 4 Channels

Time base : **2 msec/div.**

- Press **Clear Sweeps**.

- Measure for at least **50 sweeps**, then press **Stop** to halt the acquisition.
- Record the four **high sdev** parameter values in Table 4, and compare the test results to the limits in the test record.
- Repeat the test for Time base : **20 msec/div.**
- Record the measurements (high sdev of 1,2,3,4) in Table 4, and compare the results to the limits in the test record.

5.6.2 Erroneous Read / Write Test

Test limit

±2.5 % of full scale at 50 mV/div.

Procedure

a. Channel 1, Channel 2, Channel 3 and Channel 4

- For **LT Series** recall **LTxxxP015.PNL**,
for **LT 34XL** recall **LT344 P016.PNL**.

Channels Trace ON **Channel 1, Channel 2, Channel 3 & Channel 4**
 Zoom+Math Trace ON **D**
 Input Coupling : **DC 50W** on all 4 Channels
 Global BWL ON : **25MHz**

 Use W'form : **A**
 Delta V : **0.20 div**
 Delta T : **0.00 div**

- To start the test, select **MEASURE TOOLS**, **Change Test Conditions**, **Modify Mask** and press **Make Mask M1**
- **After 1000 sweeps for LT322 and LT224, or 400 sweeps for LT344 and LT342, or after 100 sweeps for LT344L** check that the number of Passed equals the number of Sweeps on all 4 Channels.
- Record the test result in Table 5.

5.7 DC Accuracy

This test measures the DC Accuracy of the absolute voltage measurements at 0V offset setting.

It requires a DC source with a voltage range of 0 V to 20 V adjustable in steps of no more than 15 mV, and a calibrated DMM that can measure voltage to 0.1 %. Measurements are made using voltage values applied by the external voltage reference source, measured by the DMM, and in the oscilloscope using the parameters Std voltage.

For each known input voltage, the deviation is checked against the tolerance.

Specification & Test limits

$$\pm(0.015 \times |V_m + V_{\text{offset}}| + 0.015 \times |V_{\text{offset}}| + 0.01 \times \text{FS} + 1\text{mV})$$

V_m [volts] = voltage reading [volts]

FS [volts] = 8[div] x sensitivity [volt/div]

V_{offset} [volts] = setting offset voltage [volts]

Procedure

▪Recall **LTxxxP017.PNL** or configure the DSO:

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels Trace ON	:	Channel 1, Channel 2, Channel 3 & Channel 4
Input Coupling	:	DC 1MW on all 4 Channels
Input offset	:	0.0 mV on all 4 Channels
Input gain	:	from 2mV/div to 1 V/div and 5V/div. (see Table 6) on all 4 Ch
Trigger setup	:	Edge
Trigger on	:	line
Slope line	:	Positive
Mode	:	Auto
Time base	:	2 msec/div.
Channel use	:	4
Record up to	:	25 k
Channels Trace OFF	:	Channel 1, Channel 2, Channel 3 & Channel 4
MATH TOOLS Trace	:	ONA, B, C & D
Select Math Setup	:	
For Math	:	Use at most 5000 points
Redefine A, B, C, D	:	Channel 1, Channel 2, Channel 3 & Channel 4
Use Math ?	:	Yes
Math Type	:	Average
Avg. Type	:	Summed
For	:	100 sweeps
MEASURE TOOLS	:	Parameters
Mode	:	Custom

Statistics : off

Change parameters

- On line 1 : Measure mean of A
- On line 2 : Measure mean of B
- On line 3 : Measure mean of C
- On line 4 : Measure mean of D

- For the low sensitivities: **2 mV, 5 mV, 10 mV and 20 mV/div.**, connect the test equipment as shown in Figure 5-1.
-

Figure 5-1: DC 1MW Accuracy Equipment Setup for 2,5,10 and 20 mV/div.

- For 100 mV/div, connect the test equipment as shown in Figure 5-2.
- For 5V/div no attenuator is required, connect the test equipment as shown in Figure 5-3.

Figure 5-2 : DC 1MW Accuracy Equipment Setup for 100 mV/div

Figure 5-3 : DC 1MW Accuracy Equipment Setup for 5V/div.

- For each **DSO Volts/div**, set the output of the external **DC voltage reference source** as shown in Table 6, column PS output.
 - 1) Connect the DMM and record the **voltage reading** in Table 6, column **DMM**.
 - 2) Disconnect the DMM from the BNC T connector.
 - 3) Press **Clear Sweeps**
 - 4) After 100 sweeps, read off the **DSO mean parameter**, and record the measurement in Table 6, column **Mean**.
- For each DC voltage applied to the DSO input, repeat parts 1), 2), 3) and 4).
- Calculate the **Difference (D)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading. Record the test result in Table 6, and compare the **Difference (D)** to the corresponding limit in the test record.
- Repeat step 5.7 Procedure for the other channels, substituting channel controls and input connector.

5.8 Offset Accuracy

The offset test is done at 5mV/div, with a signal of ± 1 Volt cancelled by an offset of the other polarity.

Specifications

$$\pm (0.015 \times V_{\text{offset}} + 0.005 \times \text{FS} + 1\text{mV})$$

$$\text{FS [volts]} = 8[\text{div}] \times \text{sensitivity}[\text{volts/div}]$$

$$V_{\text{offset [volts]}} = \text{setting offset voltage}$$

Procedure

- Recall **LTxxxP018.PNL** or configure the DSO:

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels Trace ON	:	Channel 1, Channel 2, Channel 3 & Channel 4
Input Coupling	:	DC 1MW on all 4 Channels
Input gain	:	5mV/div on all 4 Channels
Input offset	:	+1 Volt on all 4 Channels
Trigger setup	:	Edge
Trigger on	:	1
Coupling 1	:	DC
Mode	:	Auto
Time base	:	2 msec/div.
Channel use	:	4
Record up to	:	25 k
Channels Trace OFF	:	Channel 1, Channel 2, Channel 3 & Channel 4
Zoom+Math Trace ON	:	A, B, C & D
Select Math Setup	:	
For Math	:	Use at most 5000 points
Redefine A, B, C, D	:	Channel 1, Channel 2, Channel 3 & Channel 4
Use Math ?	:	Yes
Math Type	:	Average
Avg. Type	:	Summed
For	:	100 sweeps
MEASURE TOOLS:	:	Parameters
Mode	:	Custom
Statistics	:	off

- Connect the test equipment as shown in Figure 5-4.

- Set the output of the external **DC voltage reference source** to **- 1 Volt**.
 - 1) Verify that the displayed trace A : Average (1) is on the screen, near the center horizontal graticule line. If the trace is not visible, modify the **DC voltage reference source output** until the trace is within ± 2 divisions of center.
 - 2) Connect the DMM and record the **voltage reading** in Table 7, column **DMM**.
 - 3) Disconnect the DMM from the BNC T connector.
 - 4) Press **Clear Sweeps**
 - 5) After 100 sweeps, Read off the **DSO Mean parameter** voltage, and record the measurement in Table 7, column **Mean**.
- Repeat the test for the other channels, substituting channel controls and input connector. Record the measurements in Table 7.
- Repeat the test the other offset settings $-1V$ and $0V$.
Recall **LTxxxP019.PNL** for Input offset $-1V$.
Recall **LTxxxP020.PNL** for Input offset $0V$.

Record the measurements in Table 7.

- Calculate the **Difference (D)** by subtracting the **DMM voltage** reading from the **DSO mean** voltage reading.
- Record the test result in Table 7, and compare the **Difference (D)** to the corresponding limit in the test record.

5.9 Bandwidth

The purpose of this test is to ensure that the entire system has a bandwidth of at least 500MHz or 200MHz. An external source is used as the reference to provide a signal where amplitude and frequency are well controlled.

The amplitude of the generator as a function of frequency and power is calibrated using an HP8482A sensor on an HP437B power meter or equivalent.

Specifications & Test limits

DC to 500MHz (10mV to 5V/div) for LT344/L, LT342/L, LT322
 DC to 200MHz (5mV to 10V/div) for LT224

Procedure

- Recall **LTxxxP021.PNL** or configure the DSO

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels Trace ON	:	Channel 1, Channel 2, Channel 3 & Channel 4
Input Coupling	:	DC 50W on all 4 Channels
Input gain	:	50 mV/div on all 4 Channels
Input offset	:	0 mV on all 4 Channels
Trigger setup	:	Edge
Trigger on	:	Line
Slope line	:	Pos
Mode	:	Auto
Time base	:	1 msec/div.
Channel use	:	4
Record up to	:	25 k
MEASURE TOOLS	:	Parameters
Mode	:	Custom
Statistics	:	On
Change parameters	:	
On line 1	:	Sdev of 1
On line 2	:	Sdev of 2
On line 3	:	Sdev of 3
On line 4	:	Sdev of 4

- Connect the HP8482A power sensor to the power meter.
- Zero and **calibrate** the HP8482A power sensor using the power meter **Power Ref output**.
- Connect a **BNC adapter** to the HP8482A power sensor.

- Connect a 5ns 50Ω BNC cable to the **RF output** of the HP8648B generator and then through a 6dB attenuator and the necessary adapters to the power sensor.

Figure 5-5 : Power Meter Equipment Setup

- Set the generator frequency to **300 kHz**
- Set the generator amplitude to measure **0.200 mW** on the power meter.
- Read the displayed **generator output amplitude**, and record it in the third column of Table 8.
 - Repeat the above measurement for 1.1 MHz, 10.1 MHz, 100.1 MHz, **200.1MHz**, 300.1 MHz & 500.1 MHz. Record the generator output amplitude readout in the third column of Table 8.
- Disconnect the **RF output** of the HP8648B generator from the HP8482A power sensor.
- Connect the **RF output** of the HP8648B generator through a 5ns 50 Ohm BNC cable and a 6 dB attenuator into Channel 1.
- Set the generator frequency to **300 kHz**.
- From the generator, apply the **recorded generator signal amplitude** to Channel 1.
- Press **Clear Sweeps**.

Figure 5-6 : 50W Bandwidth Equipment Setup

- Measure for at least 100 sweeps, record the average value of **sdev(1)** in Table 8
- Repeat the above 3 steps for Channel 2, Channel 3 & Channel 4 substituting channel controls and input connector. Record the measurements in Table 8.
- Repeat the above measurement for all channels for 1.1 MHz, 10.1 MHz, 100.1 MHz, **200.1MHz**, 300.1 MHz and 500.1 MHz and record the values in Table 8.
- Calculate the ratio to .3MHz for each frequency.

$$\text{Ratio} = (\text{sdev of XXXMHz}) / (\text{sdev of 0.3MHz})$$
 and compare the results to the limits in the test record.

- Recall **LTxxxP022.PNL** or configure the DSO as shown in 5.9 and for each Channel make the following change :

Input gain : **100mV/div**

- Connect the test equipment as shown in Figure 5-5.
- Set the generator frequency to **300 kHz**
- Set the generator amplitude to measure **0.800 mW** on the power meter.
- Read the displayed **generator output amplitude**, and record it in the third column of Table 9.
- Repeat the above measurement for **1.1 MHz, 10.1 MHz, 100.1 MHz, 200.1MHz, 300.1 MHz & 500.1 MHz**. Record the generator output amplitude readout in the third column of Table 9.
- Disconnect the **RF output** of the HP8648B generator from the HP8482A power sensor.
- Connect the test equipment as shown in Figure 5-6.

- Set the generator frequency to **300 kHz**.
- From the generator, apply the **recorded generator signal amplitude** to Channel 1.
- Press **Clear Sweeps**.
- Measure for at least 100 sweeps, record the average value of **sdev(1)** in Table 9
- Repeat the above 3 steps for Channel 2, Channel 3 & Channel 4 substituting channel controls and input connector. Record the measurements in Table 9.
- Repeat the above measurement for all channels for 1.1 MHz, 10.1 MHz, 100.1 MHz, **200.1MHz**, 300.1 MHz and 500.1 MHz and record the values in Table 9.
- Calculate the ratio to .3 MHz for each frequency.

$$\text{Ratio} = (\text{sdev of XXXMHz}) / (\text{sdev of 0.3MHz})$$
 and compare the results to the limits in the test record.

b. DC 50W with Bandwidth Limiter On

- Recall **LTxxxP023.PNL** or configure the DSO:

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels Trace ON	:	Channel 1
Input Coupling	:	DC 50W
Global BWL	:	25 MHz
Input gain	:	100 mV/div.
Input offset	:	0 mV
Trigger setup	:	Edge
Trigger on	:	1

On line 1	:	Sdev of 1
On line 2	:	Freq of 1
- Connect the test equipment as shown in Figure 5-6.

- Set the generator frequency to **300 kHz**.
- Adjust the generator signal amplitude to measure **sdev(1) = 200 mV**.
- Set Time base : **50 nsec/div**.
- Increase the generator frequency until **sdev(1) = 140 mV**. (typically 25 MHz)
- Press **Clear Sweeps**
- When **sdev(1) = 140 mV**, record Freq(1) in Table 10.
- Check that the frequency is within the limits specified in Table 10.

The following test of BWL: 200MHz is not applied for LT224.

- Set Global BWL : **200 MHz**
- Set Timebase : **5 nsec/div.**
- Increase the generator frequency until **sdev(1) = 140 mV.** (typically 200 MHz)

- Press **Clear Sweeps**
- When **sdev(1) = 140 mV**, record **Freq(1)** in Table 10.
- Repeat the 25 MHz and 200 MHz Bandwidth limiter tests for the other channels, substituting channel controls and input connector.
- Recall **LTxxxP024.PNL** for Channel 2, **LTxxxP025.PNL** for Channel3 **LTxxxP026.PNL** for Channel 4, or configure the DSO as shown in 5.9.1 Procedure and make the necessary changes.
- Record the test results in Table 10, and compare the results to the limits.

5.10 Trigger Level

The trigger capabilities are tested for several cases of the standard edge trigger:

- Channel (internal), and External Trigger sources
- Three DC levels: -3, 0, +3 major screen divisions
- DC, HFREJ coupling
- Positive and negative slopes

5.10.1 Channel Trigger at 0 Division Threshold

a. DC Coupling

Recall **LTxxxP027.PNL** or configure the DSO:

Panel Setups : **Recall FROM DEFAULT SETUP**
 Channels Trace ON **Channel 1, Channel 2, Channel 3 & Channel 4**
 Input Coupling : **DC 50W** on all 4 Channels
 Input gain : **100 mV/div.** on all 4 Channels
 Input offset : **0 mV** on all 4 Channels (use show status to verify)

Trigger setup : **Edge**
 Trigger on : **1**
 Slope 1 : **Pos**
 Coupling : **DC**
 Mode : **Auto**
 Set Trigger level : **DC 0.0 mV**
 Pre-Trigger Delay : **50 %**

Time base : **0.1 msec/div.**
 Record up to : **50 k samples**

Channels Trace OFF **Channel 1, Channel 2, Channel 3 & Channel 4**

Zoom+Math Trace ON **A, B, C & D**

Select Math Setup

For Math : **Use at most 5000 points**
 Redefine A, B, C, D **Channel 1, Channel 2, Channel 3 & Channel 4**
 Use Math ? : **Yes**
 Math Type : **Average**
 Avg. Type : **Summed**
 For : **10 sweeps**

- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz**.
- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable and adjust the sine wave output amplitude to get **8 divisions peak to peak**.
- Select MEASURE TOOLS : **Cursors, Time, Absolute**
- Use the "cursor position" knob, to move the **Time marker** at 0.0 μ s

- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 11 the **level** readout displayed below 100 mV in the icon 1, at top left.
- Compare the test results to the corresponding limit in the test record.
- Set Trigger Slope 1 : **Neg**
- Acquire 10 sweeps and record in Table 11 the **level** readout displayed below

100 mV in the icon 1, at top left.

b. HFREJ Coupling

- Set Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 12 the **level** readout displayed below 100 mV in the icon 1, at top left.
- Set Trigger Slope 1 : **Pos**
- Acquire 10 sweeps and record in Table 12 the **level** readout displayed below 100 mV in the icon 1, at top left.
- Repeat steps 5.10.1.a. and 5.10.1.b. for all input channels, substituting channel controls (DC, HFREJ, Pos, Neg) and input connector.
Recall **LTxxxP028.PNL** for Channel 2, **LTxxxP029.PNL** for Channel 3, **LTxxxP030.PNL** for Channel 4, or select **Trigger** on the Channel under test.
The **Trigger level** is displayed in either the icon 2, 3 or 4

- Record the measurements in Table 11 & 12 and compare the test results to the corresponding limits in the test record.

5.10.2 Channel Trigger at +3 Divisions Threshold

a. DC Coupling

- Recall **LTxxxP031.PNL** or configure the DSO as shown in 5.10.1.a and for each Channel make the following change :

Set Trigger level : **DC +300 mV**

- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 11 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope 1 : **Neg**
- Acquire 10 sweeps and record in Table 11 the **level** readout displayed below 100 mV in the icon 1, at top left.

b. HFREJ Coupling

- Set Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 12 the **level** readout displayed below 100 mV in the icon 1, at top left.

- Set Trigger Slope 1 : **Pos**
- Acquire 10 sweeps and record in Table 12 the **level** readout displayed below 100 mV in the icon 1, at top left.
- Repeat steps 5.10.2.a. and 5.10.2.b. for all input channels, substituting channel controls (DC, HFREJ, Pos, Neg) and input connector. Recall **LTxxxP032.PNL** for Channel 2, **LTxxxP033.PNL** for Channel 3, **LTxxxP034.PNL** for Channel 4, or select **Trigger on** the Channel under test. The **Trigger level** is displayed in either the icon 2, 3 or 4

- Record the measurements in Table 11 & 12 and compare the test results to the corresponding limits in the test record.

5.10.3 Channel Trigger at - 3 Divisions Threshold

a. DC Coupling

- Recall **LTxxxP035.PNL** or configure the DSO as shown in 5.10.1.a and for each channel make the following change :

Set Trigger level : **DC - 300 mV**

- Connect the output of the generator to Channel 1 through a 50 Ohm coaxial cable.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 11 the **level** readout displayed below 100 mV in the icon **1**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope 1 : **Neg**
- Acquire 10 sweeps and record in Table 11 the **level** readout displayed below 100 mV in the icon 1, at top left.

b. HFREJ Coupling

- Set Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 12 the **level** readout displayed below 100 mV in the icon 1, at top left.

Panel Setups : **Recall FROM DEFAULT SETUP**
 Channel Trace ON **Channel 2**
 Input Coupling : **DC 50W**
 Input gain : **100 mV/div.**
 Input offset : **0 mV**

Trigger setup : **Edge**
 Trigger on : **Ext**
 Slope Ext : **Pos**
 Coupling Ext : **DC**
 Set Trigger level : **0.0 mV**
 External : **DC 1MW**
 Mode : **Auto**
 Pre-Trigger Delay : **50 %**
 Time base : **0.1 msec/div.**
 Record up to : **50 k samples**

Channel Trace OFF **Channel 2**
 Zoom+Math Trace ON **B**
 Select Math Setup
 For Math : **Use at most 5000 points**
 Redefine B : **Channel 2**
 Use Math ? : **Yes**
 Math Type : **Average**
 Avg. Type : **Summed**
 For : **10 sweeps**

- Connect the test equipment as shown in Figure 5-7.
- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz**.
- Adjust the sine wave output amplitude to get **8 divisions peak to peak**.
- Select MEASURE TOOLS : **Cursors, Time, Absolute**
- Use the "cursor position" knob, to move the **Time marker** at $0.0 \mu\text{s}$

Figure 5-7 : External Trigger Equipment Setup

- Press **Clear Sweeps**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

- Set Trigger Slope Ext : **Neg**

- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

b. HFREJ Coupling

- Set Coupling Ext : **HFREJ**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

- Set Trigger Slope Ext : **Pos**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

5.10.5 External Trigger at +3 Divisions Threshold

a. DC Coupling

- Recall **LTxxxP040.PNL** or configure the DSO as shown in 5.10.4.a and make the following change :

Set Ext Trigger level : **DC +300 mV**

- Connect the test equipment as shown in Figure 5-7.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext : **Neg**

- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

b. HFREJ Coupling

- Set Ext Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

- Set Trigger Slope Ext : **Pos**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

5.10.6 External Trigger at - 3 Divisions Threshold

a. DC Coupling

- Recall **LTxxxP041.PNL** or configure the DSO as shown in 5.10.4.a and make the following change :

Set Ext Trigger level : **DC - 300 mV**

- Connect the test equipment as shown in Figure 5-7.
- Press **Clear Sweeps**.
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext : **Neg**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

b. HFREJ Coupling

- Set Ext Coupling : **HFREJ**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext : **Pos**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

5.10.7 External/10 Trigger at 0 Division Threshold

a. DC Coupling

- Recall **LTxxxP042.PNL** or configure the DSO :

Panel Setups : **Recall FROM DEFAULT SETUP**
 Channel Trace ON **Channel 2**
 Input Coupling : **DC 1MW**
 Input gain : **1V/div**
 Input offset : **0 mV**

Trigger setup : **Edge**
 Trigger on : **Ext/10**
 Slope Ext/10 : **Pos**
 Mode : **Auto**
 Coupling : **DC**
 Set Trigger level : **0.0 mV**
 External : **DC 1MW**
 Pre-Trigger Delay : **50 %**
 Time base : **0.1 msec/div.**
 Record up to : **50 k samples**

Channel Trace OFF **Channel 2**
 Zoom+Math Trace ON **B**
 Select Math Setup
 For Math : **Use at most 5000 points**
 Redefine B : **Channel 2**
 Use Math ? : **Yes**
 Math Type : **Average**
 Avg. Type : **Summed**
 For : **10 sweeps**

- Connect the test equipment as shown in Figure 5-7.
- Set the output of the LeCroy LW420 or equivalent audio frequency signal generator to **1 kHz**.
- Adjust the sine wave output amplitude to get **8 divisions peak to peak** .
- Select MEASURE TOOLS : **Cursors, Time, Absolute**
- Use the "cursor position" knob, to move the **Time marker** at 0.0 μ s

- Press **Clear Sweeps**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

- Set Trigger Slope Ext/10 : **Neg**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

b. HFREJ Coupling

- Set Coupling Ext/10 : **HFREJ**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

- Set Trigger Slope Ext/10 : **Pos**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

5.10.8 External/10 Trigger at +3 Divisions Threshold

a. DC Coupling

- Recall **LTxxxP043.PNL** or configure the DSO as shown in 5.10.7.a and make the following change :

Set Ext/10 Trigger level : **DC +3 V**

- Connect the test equipment as shown in Figure 5-7.
- Press **Clear Sweeps**,
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext/10 : **Neg**

- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

b. HFREJ Coupling

- Set Ext/10 Coupling: **HFREJ**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

- Set Trigger Slope Ext/10 : **Pos**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

5.10.9 External/10 Trigger at - 3 Divisions Threshold

a. DC Coupling

- Recall **LTxxxP044.PNL** or configure the DSO as shown in 5.10.7.a and make the following change :

Set Ext/10 Trigger level : **DC - 3 V**

- Connect the test equipment as shown in Figure 5-7.
- Press **Clear Sweeps**.
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext/10 : **Neg**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.

b. HFREJ Coupling

- Set Ext/10 Coupling: **HFREJ**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

- Set Trigger Slope Ext/10 : **Pos**
- Acquire 10 sweeps and record in Table 13 the **level** readout displayed below 100 mV in the icon **2**, at top left.
- Compare the test results to the corresponding limit in the test record.

5.11 Smart Trigger

5.11.1 Trigger on Pulse Width 10 nsec

a. Pulse Width < 10 nsec

- Recall **LTxxxP045.PNL** or configure the DSO
 - Panel Setups : **Recall FROM DEFAULT SETUP**
 - Channels trace ON **Channel 1**
 - Input coupling : **DC 50W**
 - Input gain : **.5 V/div.**
 - Input offset : **0 mV**
 - Trigger setup : **Smart**
 - Setup Smart Trigger **Glitch**
 - Trigger on : **1**
 - At the end of : **Neg.**
 - Width < 10 nsec : **On**
 - Width > 10 nsec : **Off**
 - Trigger mode : **Norm**
 - Time base : **5 nsec/div.**
- Connect the **RF output** of the HP8648B generator through a 5ns 50 Ohm BNC coaxial cable into Channel 1.
- Set the generator frequency to **100 MHz**. Adjust the generator output amplitude to get **5 divisions peak to peak** .
- Check that the scope Triggers. Record the test result in Table 14.
- Set Width < 10 nsec **Off** and Width > 10 nsec **ON**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box next to normal. Record the test result in Table 14.

b. Pulse Width > 10 nsec

- Set the generator frequency to **40 MHz**.
- Set Width < 10 nsec **Off** and Width > 10 nsec **ON**
- Check that the scope Triggers. Record the test result in Table 14.
- Set Width < 10 nsec **On** and Width > 10 nsec **Off**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box. Record the test result in Table 14.

5.11.2 Trigger on Pulse Width 100 nsec

a. Pulse Width < 100 nsec

- Recall **LTxxxP046.PNL** or configure the DSO as shown in 5.11.1.a and make the following changes :
 - Width < 100 nsec : **On**
 - Width > 100 nsec : **Off**
 - Time base : **20 nsec/div.**
- Set the generator frequency to **10 MHz**.
- Check that the scope Triggers. Record the test result in Table 14.
- Set Width < 100 nsec **Off** and Width > 100 nsec **ON**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box next to normal. Record the test result in Table 14.

b. Pulse Width > 100 nsec

- Set the generator frequency to **4 MHz**.
- Time base : **50 nsec/div.**
- Set Width < 100 nsec **Off** and Width > 100 nsec **ON**
- Check that the scope Triggers. Record the test result in Table 14.
- Set Width < 100 nsec **On** and Width > 100 nsec **Off**
- Check that the scope **doesn't trigger** : slow trigger and no flashes in box. Record the test result in Table 14.

5.12 Time Base Accuracy

An external sine wave generator of **0.1 MHz** with a frequency accuracy better than 1 PPM is used.

Specifications & Test limit

Clock: accuracy: **±0.001 % or ±10 PPM**

Procedure

- Recall **LTxxxP047.PNL** or configure the DSO

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels trace ON	:	Channel 1
Input coupling	:	DC 50W
Input gain	:	.1 V/div.
Input offset	:	0 mV
Trigger setup	:	Edge
Trigger on	:	1
Coupling 1	:	DC
Slope 1	:	Pos
Level 1	:	100 mV
Trigger mode	:	Norm
Delay	:	0 %
Time base	:	10 nsec/div.
Channel use	:	4
Record up to	:	50 k

- Connect the **RF output** of the HP8648B generator through a 5ns 50 Ohm BNC coaxial cable into Channel 1.
- Set the generator frequency to **0.1 MHz**.
- Adjust the generator output amplitude to get **5 divisions peak to peak**.
- Store Channel 1 in Memory 1
- Recall **LTxxxP048.PNL** or make the following change :
- Set Post-trigger delay to **50.00 msec**
- Recall Memory **1 to A**
- Press : **MEASURE TOOLS**

- Measure : **Parameters**
- Mode : **Custom**
- Statistics : **Off**

- Change parameters

- On line 1 : **Delay of 1**
- On line 2 : **Delay of A**

- Check that the displayed Channel 1 trace is **aligned** with the sine wave from memory 1.

- This allows the accuracy of the time base clock to be checked **5000 periods** after the trigger point. A difference of **±0.5 msec** corresponds to **±10 PPM**.

- Calculate the Difference **{[delay(A) - delay(1)]+ 50 msec}**.
- Record the test result in Table 15, and compare it to the limit in the test record.

5.13 Overshoot and Rise time (10 % - 90 %)

Test limit

Overshoot < 12%, rise time < 0.80 ns LT344/L, LT342/L, LT322
 Overshoot < 10%, rise time < 1.9 ns LT224

Procedure

- Recall **LTxxxP049.PNL** or configure the DSO

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels trace ON	:	Channel 1
Input coupling	:	DC 50W on all 4 Channels
Input gain	:	0.1 V/div. on all 4 Channels

5.14 Overload

Test limit

1 Watt into 50Ω : Overload Trip < 30 seconds

a. Channel Overload Trip

- Recall **LTxxxP053.PNL** or configure the DSO

Panel Setups	:	Recall FROM DEFAULT SETUP
Channels Trace ON	:	Channel 1, Channel 2, Channel 3 & Channel 4
Input coupling	:	DC 50W on all 4 Channels
Input gain	:	1 V/div. on all 4 Channels
Input offset	:	- 3.5 V on all 4 Channels
Trigger setup	:	Edge
Trigger on	:	1
Coupling 1	:	DC
Slope 1	:	Pos
Level 1	:	0 V
Trigger mode	:	Norm
Delay	:	zero
Time base	:	2 sec/div.
Channel use	:	4
Record up to	:	1000 samples

- Set the output of the external **DC voltage source** to **+7.07 Volt** corresponding to 1 Watt into 50Ω.
- Connect the **DC voltage reference source** through a BNC cable into Channel1.
- When the channel **overload trips** press **Stop** to halt the acquisition.
- Measure** on the screen the **overload trip time** and record it in Table 17.
- Repeat the above tests for Channel 2, Channel 3 and Channel 4 substituting the input connector.
- Record the test results in Table 17, and compare the results to the limits.
- For all Channel **clear the overload** by selecting DC 50Ω in the Coupling menu.
- Set Time base : **5 sec/div.**

- Set the output of the external **DC voltage source** to **+5.00 Volt** corresponding to 0.5 Watt into 50Ω.
- For all channels check that the overload doesn't trip for at least **60** seconds. Record the test result in Table 17.

b. External Overload Trip

- Recall **LTxxxP054.PNL**, or configure the DSO as shown in 5.14.a and make the following changes.

Channel Trace ON : **Channel 2**
Input coupling : **DC 1MW**
Trigger on : **Ext**
Slope Ext : **Pos.**
External : **DC 50W**
Mode : **Norm**
Set Trigger level : **DC 0.0 mV**

- Connect the test equipment as shown in Figure 5-10.
- Set the output of the external **DC voltage source** to **+7.07 Volt**

Figure 5-10 : External Overload Equipment Setup

- When the External **overload trips** press **Stop** to halt the acquisition.
- Measure** on the screen the **overload trip time** and record it in Table 17.
- Press **clear overload** in the trigger setup menu.

- Set Time base : **5 sec/div.**
- Set the output of the external **DC voltage source** to **+5.00 Volt**
- Check that the External overload doesn't trip for at least 60 seconds. Record the test result in Table 17.

6. Maintenance

6.1 Introduction

This section contains information necessary to maintain, calibrate and troubleshoot the LeCroy waverunner digital storage oscilloscopes.

6.1.1 Safety Precautions

The  symbol used in this manual indicates dangers that could result in personal injury.

The  symbol used in this manual identify conditions or practices that could damage the instrument.

The following servicing instructions are for use by qualified personnel only. Do not perform any servicing other than contained in service instructions. Refer to procedures prior to performing any service.

Exercise extreme safety when testing high energy power circuits. Always turn the power OFF, disconnect the power cord, discharge the cathode ray tube and all capacitors before disassembling the instrument.

6.1.2 Antistatic Precautions

Any static charge that builds on your person or clothing may be sufficient to destroy CMOS components, integrated circuits, Gate array's.....etc.

In order to avoid possible damage, the usual precautions against static electricity are required.

- Handle the boards in antistatic boxes or containers with foam specially designed to prevent static build-up.
- Ground yourself with a suitable wrist strap.
- Disassemble the instrument at a properly grounded work station equipped with antistatic mat.
- When handling the boards, do not touch the pins.
- Stock the boards in antistatic bags.

6.2 Software Update Procedure

6.2.1 Upgrading Firmware

LeCroy Corporation has a policy of continually improving and upgrading its products.

The LT Series instrument is equipped with flash Prom on processor board. The software is updated to the latest version using either the floppy disk drive or the memory card interface.

After any software change, reboot the scope or perform a general reset of the instrument by simultaneously depressing the F2 button, the F5 menu button and the CH1 button.

a. Performing the Update from Floppy

- Format a single high density 1.44Mb floppy in the scope (not in the PC)
- Create a directory LECROY_P in the root directory of the disk
- Copy the file VXFOUND.FLA, into the directory created above.
- Label this disk “ Firmware Update Disk “
- Cycle power to the scope with no floppy inserted.
- When the scope boots enter the “Show Status“ , “System“ menu to verify that version 08.1.1 or later is currently running.
- Insert the Firmware Update Disk into the scope’s floppy drive.
- Select “Utilities“, “Special Modes“, “Firmware Update“, “Update from Floppy“ .
- Press twice “Update Flash“.
- Wait for two minutes until displaying “FLASH UPDATE SUCCESSFUL”on the DSO.
- When the operation is complete remove the floppy and reboot the scope.
- When the scope boots enter the “Show Status“, “System “ menu to verify that the new version is currently running.

Warning:

Reprogramming the Flash memory is a procedure to be perform with care.

Any loss of power during the update process could cause the scope to require Factory service.

Note that once software has update it is not possible to revert to the previous software version.

b. Performing the Update from Card

- Format a 2Mb SRAM memory card
- Create a directory LECROY_P in the root directory of the card
- Copy the file VXFOUND.FLA, into the directory created above.

- Cycle power to the scope with no floppy or card inserted.
- When the scope boots enter the "Show Status" , "System" menu to verify that version 8.1.1 or later is running.
- Insert the Card created above into the PCMCIA Slot.
- Select "Utilities", "Special Modes", "Firmware Update", "Update from Card" .
- Press twice "Update Flash".
- Wait for two minutes until displaying "FLASH UPDATE SUCCESSFUL"on the DSO.
- When the operation is complete remove the card and reboot the scope.
- When the scope boots enter the "Show Status", "System " menu to verify that the new version is currently running.

6.2.2 Software Options

The following software options are available:

- EMM Extended Math & Measurement
- WAVA Wave Analysis
- MC01 PCMCIA Memory Card
- JTA Jitter and Timing Analysis

6.2.2.1 Changing Software Option Key

a. Scope ID, Scope Serial Number

The scope ID and scope s/n: are used to request a Software Option Key

- Enter the scope's Software Options menu (located under the **STATUS, SYSTEM** menu).
- Note the **SCOPEID**, i.e: C63B9B-A5 and **Scope s/n**: LT34400156 that are found on that menu.

b. Entering Option Key in the DSO

- Enter the scope's Software Options menu (**STATUS, SYSTEM** menu).
- Enter the **ADD OPTION KEY** menu on the DSO
- Enter the new option key using the dymo-editor, i.e: **C4B5-F4A9-4464-E7ED**
- Click on **ENTER THIS OPTION KEY** to add the key
- Reboot the scope and verify that the options added correctly.

Then check in the system summary, by using the show status button on the front panel, the scope serial number.

6.3 Equipment and Spare Parts Recommended for Service

6.3.1 Test Equipment Required

See Table 5-1 in section 5.2.

6.3.2 LT Series Spare Parts

Parts Number	Assembly	Adjustments or Confirmations	Performance Tests
213025610	CPU Board without DRAM	6.5.1	None
213025605	Main Board for LT344/344L without HMM436's	6.5.2	None
213025650	Main Board for LT342/342L without HMM436's	6.5.2	None
213025648	Main Board for LT322 without HMM436's	6.5.2	None
213025670	Main Board for LT224 without HMM436's	6.5.2	None
213025678	Front Cover(4CH)for LT344/224	None	None
213025679	Front Cover(2CH) for LT342/322	None	None
213025680	8.4"Color TFT LCD Display Assy	None	None
213025615	Power Board	6.5.3	None
DMB020691	Floppy Disc Drive	None	None
213025681	Printer Assy	None	None

The other parts are not on the above list because the probability of failure is very low.

See [chapter 7](#) and [8](#) for mechanical and electrical replaceable parts.

6.4 Board Exchange Procedure

6.4.1 Processor Board Exchange Procedure

The serial number of the LT Series oscilloscope is loaded in the real time clock memory which is battery backed up. If it becomes necessary to replace the processor board, the serial number must be loaded in the memory of the new board by using LeCroy program " LeCalsoft " under GPIB remote control.

To run " LeCalsoft " type SKP.exe, in the main menu type S, and follow the instructions, use five digits to enter the serial number (i.e. 10281).

Then check in the system summary, by using the show status button on the front panel, the scope serial number.

6.4.2 Main Board Exchange Procedure

After Main Board is exchanged, adjust as the following method.

- Assemble the lower cover and upper cover.
- Plug in the power cord and turn on the LT Series.
- Wait for fifteen minutes.
- Enter the internal menus by pressing menu soft-keys 3 & 4, then release soft-key 3, then release soft-key 4, then press soft-key 5.
- Select **“Maintenance”**, **“Board Test Results”**, **“Adjust”**.
- Press **“Measure Board Items”**, and wait till **“Succeeded”** is displayed.
- Press **“Measure Overload”**, and wait till **“Measure Complete”** is displayed.
- Press **“Save Result to EEPROM”** two times.

Note ; Do not press the other menu keys, or some calibration data of Main Board may be lost.

This section does not include the other manual adjustments of Main Board, and does not contain any instructions or descriptions about Main Board calibration. Main Board adjustments required complex test set-up and calibration Software. For information on the availability of the tester and software, contact your nearest LeCroy service centre.

6.4.3 Power Board Exchange Procedure

After Power Board is exchanged, confirm the voltage as the following procedure.

- Remove the upper cover and the lower cover. (see 7.G)
- Turn the scope upside down.
- Turn on the power, set the scope to **Auto Trigger** and **500MS/s**.
- Confirm the following voltage on solder side of Main Board within ten minutes.

+12V analog	(Min = +11.76V, Max = +12.24V)	21C11
+5V analog	(Min = +4.925, Max = +5.075V)	21C21
-5V analog	(Min = -4.975V, Max = -5.05V)	21C71
-12V analog	(Min = -11.76V, Max = -12.24V)	21C61
+5V digital	(Min = +4.85V, Max = +5.15V)	21C41
-4.5V digital	(Min = -4.365V, Max = -4.635V)	21C91

Note ; Do not turn the potentiometers on Power Board.

Do not keep the condition that the lower cover is removed, or the heat sinks will become hot and the condition may damage some components on Main Board.

This section does not include the other manual adjustments of Power Board, and does not contain any instructions or descriptions about Power Board calibration. Power Board adjustments required complex test set-up.

For information on the availability of the tester, contact your nearest LeCroy service centre.

6.5 Troubleshooting and Flow Charts

6.5.1 Introduction

The troubleshooting information contained in this section is intended for use by qualified personnel having a basic understanding of electronics (analog and digital). In order to simplify servicing and minimise downtime, the following list of possible symptoms, likely causes, and troubleshooting steps have been prepared. The first step in troubleshooting is to check for obvious items like blown fuses. The power supply is the next item to check before proceeding to more detailed troubleshooting, since noise or low power supply voltages can cause a variety of digital and analog problems.

6.5.2 Line Fuses Replacement

The power supply of the oscilloscope is protected against short circuits and overload by means of two T6.3A / 250 V fuses located above the main plugs.

Turn off the power and disconnect the line cord from the instrument
Disconnect the instrument from other equipment.

To replace line fuses, proceed as follow:

- Open the fuse box by inserting a small flat screwdriver under the plastic cover and remove the fuse carrier from the holder
- Remove the fuse and replace it with the proper type: T6.3 A / 250 V, LeCroy part number: **433 162 630**

6.5.3 Initial Troubleshooting Chart

Most procedures in this section will allow troubleshooting down to the **BOARD LEVEL**.

Defective circuit boards will be repaired or exchanged by the regional LeCroy service office or the local representative (see section 2.2).

6.5.4 Fan Problem

6.5.5 Power Supply Voltage Problem

6.5.6 Display Problem

6.5.7 Front Panel Controls Do not Operate

6.5.8 Remote Control GPIB or RS232 Problem

6.5.9 Floppy Disk Drive Problem

6.5.10 Performance Verification Fails

6.5.11 Graphic Printer Problem

6.5.12 Centronics Problem

6.5.13 Hard Disk Drive Problem

7. Mechanical Parts & Removal

A. Removal of the Upper Cover Assembly (with printer)

- A1, A2 : Remove the nine M3 x 6 screws with nylon washer (one on the top/each two on the right and left sides/four on the rear).
- A3 : In the case of a unit with a built-in printer (option), open the printer cover and depress the locking latch.
- A4 : Slide the upper cover rearward by approx. 5 mm. It is firm.
- A5 : Remove the upper cover by opening and lifting the lower portion of the cover.

B. Removal of the Bottom Cover Assembly

- Remove the upper cover.
- Remove the five M3 x 6 screws (with nylon washer, 3 on the bottom/2 on the rear).

Bottom Cover Replaceable Parts

Item	IWATSU Part Number	Quantity	Description
1	KBA786921	1.0	BOTTOM COVER LE
2	KAS137811	4.0	BOTTOM FOOT ASSY
3	KCM131421	2.0	Rotor for the tilt stand
4	MKB130062	5.0	Screw M3x6
5	MPW930000	5.0	Washer W-3, nylon

C. Removal of the Printer Assembly

Remove the upper cover.

- C1 : Remove the four M3 x 6 screws (2 on the TOP FRAME L/2 on the center frame).
- C2 : Remove the CPU J7/FFC cable.
- C2 : Remove the POWER BOARD CN6/power 3P cable.

2 to 15	21302-5681	1.0	LT PRINTER UNIT(GP02) See Fig [C3, C4]

D. Removal of the Floppy Assembly

Remove the upper and bottom covers.

- D1 : Remove the CPU BOARD J2/FFC cable from the CPU.
- D1 : Remove two M3 x 6 screws on the TOP FRAME R and FRONT FRAME A.

[D1]

[D2]

Floppy Replaceable Parts

Item	IWATSU Part Number	Quantity	Description
1	MKB130062	2.0	Screw M3x6
2	DMB020691	1.0	FD DRIVE WIDE-00B See Fig [D2]
3	KBA785211	1.0	FDD SUPPORT PLATE
4	MSQ903521	2.0	Screw M2.5x4

E. Removal of the CPU Board

Remove the upper and bottom covers.

Remove the printer and floppy.

Remove the four M3 x 6 screws from the right and left frame.

[Note] Remove the cables on the CPU Board and next the screws on it.

- E1 : Remove the four FFC cables on the CPU Board (J3/26pin, J4/22pin, J5/26pin, J8/22pin).
- E1 : Remove the two FFC cables on the CPU Board (J1/30pin, J6/22pin).
- E1 : Remove the P5 power connector on the CPU Board (to LCD).
- E1 : Remove the P11 power connector on the CPU Board (to POWER).
- E2 : Remove the four M3 x 6 screws (4 on the rear, fastening between connectors and between the rear panel and CPU).
Remove the eight M3x6 screws on the TOP FRAME L and R.
- E3 : Remove the six M3 x 6 screws on the CPU Board and remove the processor board by sliding it toward the front side.

Caution : Batteries are mounted, so care should be taken to prevent short-circuiting.

[E1]

3	KBA784421	1.0	TOP FRAME L
4	KBA784511	1.0	TOP FRAME R

F. Removal of the Main Board

Remove the upper and bottom covers.

[Note] Remove the cables on the Main Board and next the screws on it.

- F1 a/b : Remove the four FFC cables (20J1/26pin, 20J4/22pin, 20J2/26pin, 20J3/22pin).).
- F1 a/b : Remove the Signal out connector (16J2).
- F1 a/b : Remove the 7P power connectors (21J1, 21J2, 21J3) while pressing the stopper of 21J1 and 21J2.
- F1 a/b : Remove the two support PNC20 from the main board.
- F1 a/b : Remove the nine M3 x 6 screws (on the Main Board).
- Remove the main board by lifting its rear side slightly and sliding it rearward.

[F1a]

Main Board Replaceable Parts

Item	Part Number	Quantity	Description
1	MKB130062	11.0	Screw M3x6

[F1b]

[F2]

G. Removal of the Power Supply Assembly

Remove the upper and bottom covers.

Remove the processor assembly.

Remove the main assembly.

- G1 : Remove the Harnessing belt on the main frame.
- G2 : Remove the connector (CN7) on the Power board from the fan.
- G2, G3 : Remove the seven M3 x 8 screws (2 on the rear inlet/4 on either side/1 on the top).

[G1]

2	MKB130082	8.0	Screw M3x8
3	21302-5615	1.0	Power Board ASSY

H. Removal of the Front Panel Assembly

Remove the upper and bottom covers.

Remove the processor assembly.

Remove the main assembly.

Remove the power supply assembly.

- H1 : Remove the two M3x6 screws that secure the front panel assembly and the main frame.
- H1 : Remove the three M3 x 6 screws on the each side frames R and L.
- H2 : Inverter plate: Remove the two M3 x 6 screws.
- H2 : Inverter board: Remove the two tap tight M2 x 6 screws.
- H2 : Remove the eight a screws that secure the BEZEL and FRONT FRAM A/B.

LCD Assembly : H3, H4, H5

- H3 : Remove the four LCD mounting screws.
- H4 : Remove the connection board between LCD and KEY BOARD while holding the connectors.

FRONT PANEL ASSY : Remove the knobs.

- H6 : Remove the nine screws that secure BEZEL and KEY BOARD.

Caution : knob12 UL-1(4)TIME/DIV, VOLTS/DIV, ZOOMx2

knob09 UL-1(7)

How to insert knobs : Match the straight portions.

I. Removal of the Rear Panel Assembly

Remove the upper and bottom covers.

Remove the processor assembly.

Remove the main assembly.

Remove the power supply assembly.

- I1 : Remove the rear panel assembly and four M3 x 6 screws from the main frame.
- I2 : Remove four fan motor fastening M3 x 6 screws.

[I1]

[I2]

Rear Panel Replaceable Parts

Item	IWATSU Part Number	Quantity	Description
1	KBA785111	1.0	REAR FRAME
2	KCM138221	4.0	Cord rack 78 UL-I
3	KSN091911	1.0	WIRE NET(MESH #5)
4	MKB130062	8.0	Screw M3x6
5	MSM140101	4.0	Screw SM1-4X10
6	DMT620701	1.0	FAN 109R1212M114

Assembly Note :

- **Fan** : Check the fan cable direction. Note the air flow, the fan extracts air from the unit and expels it.
- **Feet** : Check that the lower feet and rear cord rack are aligned and properly tightened before re-assembly.
- **Floppy** : Adjust the floppy position to obtain the front face tangential to face of the front panel. Check that the door is moving freely and shuts correctly. Insert a floppy and eject it to check the mechanism.
- **Front Panel** : Check that knobs rotate freely, are the right size and in the right place. Do not forget the gasket, see Fig [H6].
- **Main Board** :The main card must be parallel and tacked against the bend of the lower cover. Being careful not to bend the board or damage components underneath.
- **Processor** : Check that the memory card insertion guide is correctly inserted in the front panel.
- **Printer** : If the graphic printer is used, before closing don't forget to plug input cable to the option and the driver cable to the processor card.

8. Schematics, Layouts, Parts List

8.1 Schematics, Layouts

This chapter contains the schematics, layouts and parts list of the following subassemblies:

POWER BOARD

Appendix A: Replaceable Parts

To order parts, contact your local LeCroy service office. A list of the service centers is given in section 2 of this manual. For boards, you can either order a new board or an exchange board. Exchange assemblies are factory repaired, inspected, tested and calibrated. If you order an exchange card, you must return the defective part.

This section applies to the following model : LT342
