SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT (MAIN AND APC UNITS)

Received signals enter the antenna connector and pass through a bandpass filter (L2~L4, L13, C21 ~C25, C30, C32, C60). The signals are applied to the antenna switching circuit (D7, D9, L5, L6, C27) and then to the RF UNIT via the RFIN signal line. The antenna switching circuit employs a two-stage $\lambda/4$ -type diode switching system.

The antenna switching circuit functions as a low-pass filter while in receiving and becomes very high impedance while in transmitting.

4-1-2 RF CIRCUIT (RF UNIT)

The signals from the antenna switching circuit are applied to the RF amplifier circuit (Q1), the bandpass filter (L1) and are then applied to the RF amplifier circuit (Q2).

The amplified signals are reapplied to the other bandpass filter (L2). The bandpass filters consisting of helical coils suppress out-of-band signals. The signals are applied to the 1st mixer circuit (MAIN UNIT Q1).

4-1-3 1ST MIXER CIRCUIT (MAIN UNIT)

The signals from the RF circuit are mixed with the 1st LO signal from the PLL UNIT to produce a 30.875 MHz 1st IF signal.

4-1-4 1ST IF CIRCUIT (MAIN AND DET UNITS)

After passing through the matching circuit (L1), the 1st IF signal is applied to a pair of crystal filters (F11) to suppress out-of-band signals. The 1st IF signal enters the DET UNIT and is amplified at the IF amplifier (Q2) and then applied to the 2nd mixer circuit.

4-1-5 2ND IF AND DEMODULATOR CIRCUITS (DET UNIT)

The 1st IF signal from Q2 is applied to the 2nd mixer section of IC1, and is mixed with the 2nd LO signal to be converted to a 455 kHz 2nd IF signal.

IC1 contains the 2nd mixer, local oscillator, limiter amplifier and quadrature detector circuits. The local oscillator section and X2 generate 30.42 MHz for the 2nd LO signal.

The 2nd IF signal from the 2nd mixer (IC1, pin 4) passes through the ceramic filter, F11, where unwanted signals are suppressed. It is then amplified at the limiter amplifier section (IC1, pin 6) and applied to the quadrature detector section (IC1, pin 10 and ceramic discriminator X1) to demodulate the 2nd IF signal into an AF signal.

AF signal output from IC1 pin 11 is applied to the squelch circuit and de-emphasis circuit (R7, C24, C25). This de-emphasis circuit is an integrated circuit with frequency characteristics of -6 dB/octave. The resulting signal is applied to the AF amp, optional tone squelch and optional DTMF decoder circuits.

RECEIVER CIRCUIT BLOCK DIAGRAM

Fig. 1

4-1-6 AF AMP CIRCUIT (AF AND VR UNITS)

The AF signal is applied to Q1 and Q2 on the AF UNIT. Q1 is an active filter that functions as a high-pass filter to suppress tone signals for the tone squelch operation. Q2 is also an active filter that functions as a low-pass filter to suppress higher noise signals.

The filtered signal is applied to the [VOL] control (R1) on the VR UNIT via the AF mute circuit (Q3). When the squelch is closed, Q3 cuts the AF signal as the AF mute switch. The AF signal is power-amplified at the AF power amplifier (IC1) to drive the speaker.

The AF voltage regulator (Q4~Q6) supplies power to the AF power amplifier. The AFS signal from the MAIN UNIT controls Q6 and mutes AF output while receiving no signal or no specified tone/DTMF signal.

4-1-7 SQUELCH CIRCUIT (DET UNIT)

Some of the noise components in the AF signal from IC1 pin 11 are applied to IC1 pin 13 via C11, R8, C13 and C14. The [SQL] control (R2) on the VR UNIT adjusts the pin 13 input level.

The active filter section in IC1 amplifies noise components of frequencies of 20 kHz and above, and outputs the resulting signals from pin 14. Output signals are rectified by D1 and are converted to DC voltage.

The rectified voltage triggers the squelch switch (Q1). The collector of Q1 outputs the squelch signal. The signal is applied to the CPU (IC1, pin 27) on the LOGIC UNIT through the BUSY signal line. The CPU outputs the RMUTE and BUSY LED signals.

The RMUTE signal, decoded at the output expander (IC1) on the IO UNIT, activates the AF mute circuit (Q3) on the AF UNIT to cut the AF signal. The BUSY LED signal is applied to Q1 on the LOGIC UNIT, turning OFF the receive indicator.

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER (MIC UNIT)

AF signals from the built-in condenser microphone or from the [MIC] jack are applied to IC1 pin 3, and are pre-emphasized to +6 dB/octave through C6 and R4 connected to pin 2. IC1 functions as the microphone amplifier and the limiter.

The output signals from IC1 pin 1 pass through the splatter filter circuit (IC1 pins 5 and 6) where signals of 3 kHz and above are attenuated. IC1 pin 7 then outputs the signals. The signals are applied to the modulation circuit (VCO UNIT, D3) to produce an FM signal.

The VCO circuit (Q1, L1, D1) oscillates the transmit frequency with AF signal modulation as a PLL output.

4-2-2 DRIVE AMPLIFIER (MAIN UNIT)

The PLL output (LO signal line) is buffer-amplified at Q9 and is then applied to the transmit/receive switching circuit (D14). The PLL output is then amplified at the predrive amplifier (Q7) and the drive amplifier (Q6).

The voltage controlled by the APC circuit is applied to the collector of Q6 and Q7 to protect the RF power module from damage by an antenna mismatch.

4-2-3 RF POWER AMPLIFIER (MAIN UNIT)

IC1 is a power module which provides stable 5 W output power.

An RF signal from the drive amplifier (Q6) is applied to IC1 pin 1. The amplified signal is output from pin 5, and applied to the antenna connector through the diode switching and bandpass filter circuits.

TRANSMITTER CIRCUIT BLOCK DIAGRAM

Fig. 2

4-2-4 APC CIRCUIT (MAIN AND APC UNITS)

The APC circuit protects the power module (IC1) from a mismatched output load and selects HIGH and LOW output power.

The output power level from the power module (IC1) is detected at the APC detector (D10~D12). When antenna impedance is matched at 50 Ω , the detected level is at a minimum. However, when antenna impedance is mismatched, the detected voltage is higher than when matched.

When the antenna impedance is mismatched, the base voltage of Q3b (APC UNIT) is higher than the other base voltage of Q3a (reference voltage). Q3b decreases the collector current of Q1 using Q2. Collector current of Q1 is used at the drive amplifiers (Q6, Q7) on the MAIN UNIT. Hence, when the antenna impedance is mismatched, the output power is decreased.

The output power selecting circuit uses the APC circuit. The PCON voltage from the IO UNIT shifts the reference voltage, changing the output power to HIGH or LOW 1~3.

4-2-5 ANTENNA SWITCHING CIRCUIT (MAIN UNIT)

When transmitting, D7 and D9 are turned ON. The RF output signal is not applied to the receiver circuit, passing through D9, the bandpass filter (L2~L4, L13, C21~C25, C30, C32, C60) and then to the antenna. The bandpass filter suppresses high harmonic components.

4-3 PLL CIRCUITS

4-3-1 GENERAL (PLL UNIT)

The PLL circuit, using a one chip modulus prescaler (IC1), directly generates the transmit and 1st LO frequencies with the VCO (Q1). The modulus prescaler (IC1) sets the dividing ratio based on serial data from the CPU, and compares the phases of a VCO signal and the reference oscillator frequency. It detects the out-of-step phase and outputs it. The reference frequency is oscillated at X1.

4-3-2 REFERENCE OSCILLATOR CIRCUIT (PLL UNIT)

A reference frequency is produced by the local oscillator section of IC1 and X1. C17 provides frequency control.

PLL CIRCUIT

Fig. 3

4-3-3 LOOP FILTER CIRCUIT (PLL UNIT)

Phase-detected signals from IC1 pin 13 are converted to DC voltage by a lag-lead loop filter (R27, R28, C40, C43).

The frequency at which the VCO oscillates is controlled by varactor diode (D1). DC voltage (PLL lock voltage) is provided through the buffer amplifier (Q6).

4-3-4 VCO CIRCUIT (VCO UNIT)

The VCO circuit (Q1, L1, D1) generates the receive and transmit frequencies and makes an FM modulation.

D2 changes the inductive reactance of the VCO, shifting the receive and transmit frequencies using a control signal from IC1 pin 10. Varactor diode (D1) provides frequency control. The buffer amplifiers (Q2, Q3, Q4) do not affect the PLL output signal from VCO oscillation.

4-3-5 UNLOCK SENSOR CIRCUIT (PLL UNIT)

When the PLL circuit is unlocked, IC1 pin 14 is "HIGH" and the "HIGH" signal is applied to the CPU pin 7 as an unlock signal.

4-4 POWER SUPPLY CIRCUITS

AF 7 V	AF amp power source controlled by the AFS signal line. R14/R15 provides reference voltage.

4-4-2 CPU POWER SUPPLY CIRCUIT (LOGIC UNIT)

When the internal* or attached battery pack is discharged, a voltage is applied to the CPU (IC1) pin 73 via R29 from the lithium backup battery (BT1) installed in the transceiver to provide backup for the memory contents.

When the internal* or attached battery pack voltage or external DC power is applied to the transceiver, BT1 is charged using the current regulator (Q3).

4-4-3 +5S AND R+5S SWITCHING CIRCUITS (REG UNIT)

The IC-4SAT/SET and IC-4SA/SE have a power saver to reduce current consumption to approx. 1/4.

The PSC (Power Saver Control) signal is applied to IC2. IC2 controls +5S regulator (Q3, Q4, D1) to turn ON and OFF +5S voltage.

PSC and SEND signals are applied to IC3. IC3 controls R+5S regulator (Q5, Q6, D2). R+5S turns OFF during power saved period or transmitting.

4-4-4 CHARGING CIRCUIT (PRT UNIT)

Voltage from the [DC 13.8V] jack is applied to current control circuit (Q1, Q2, D5, D6) to charge an internal* or attached battery pack (except the BP-85).

When the external battery pack is attached, the current from D2 charges the attached battery pack. When the external battery pack is removed, the current from D2 charges the internal battery pack.*

The IC-4SAT/SET has an external battery switch. When a battery pack is attached, this switch connects the external battery to the charging circuit.

Over voltage protector (D4) decreases the transceiver circuit damage from over voltage and reverse polarity connections of the power supply.

*The internal battery is equipped with the IC-4SAT/SET only.

4-5 OTHER CIRCUITS

4-5-1 S/RF INDICATOR CIRCUIT (DET, MAIN AND LOGIC UNITS)

A portion of the 2nd IF signal is output from IC1 pin 12 on the DET UNIT via the SD signal line. The signal is rectified at D1 on the MAIN UNIT to obtain an S-indicator signal. The S-indicator signal is applied to IC2b pin 5 on the LOGIC UNIT.

IC2b pin 6 receives an S-indicator reference signal from the CPU KEYS0~3 terminals via the D/A converter (R11, R37~R40). The CPU terminals increase the reference signal level.

When the D/A converted level becomes greater than the S-indicator level, IC2b pin 7 becomes "LOW." The CPU detects the signal strength level using the KEYS0~3 terminal outputs and indicates the signal strength level on the function display when receiving the "LOW" signal.

While transmitting, the S/RF indicator indicates the selected output power.

S INDICATOR CIRCUIT

Fig. 4

4-5-2 DISPLAY BACKLIGHT CIRCUIT (LOGIC UNIT)

When the [LIGHT] switch is pushed, pin 77 of the CPU outputs "HIGH." The signal is applied to Q1 to light up the backlight LEDs (DS2, DS3).

4-5-3 1750 Hz TONE CALL CIRCUITS (LOGIC UNIT)

Only the IC-4SET/SE is equipped with this function.

When the [PTT] switch is quickly pushed 2 times or when the [PTT] switch is pushed with the [LIGHT] switch, pin 79 of the CPU (TONE OUT) outputs a 1750 Hz tone signal. R15 adjusts the 1750 Hz tone deviation. The signal is also output to the AF UNIT via R12.

4-5-4 SUBAUDIBLE TONE ENCODER CIRCUIT

This function can be activated only when an optional UT-50 TONE SQUELCH UNIT or UT-51 PROGRAMMABLE TONE ENCODER UNIT is installed.

A tone signal is applied to the splatter filter circuit on the MIC UNIT via the TONE signal line. R10 on the UT-50 and R5 on the UT-51 adjust the subaudible tone deviation.

4-5-5 DTMF ENCODER CIRCUIT (LOGIC UNIT)

This function can be activated only when the matrix KEYS1→KEY11 is OPEN. (an optional UT-49 DTMF DECODER UNIT is installed.)

Pins 70 and 71 of the CPU (TONEC/TONER) output a DTMF code signal. R16 adjusts the DTMF code signal deviation. The signal is also output to the AF UNIT via R17.

4-5-6 CPU RESET CIRCUIT (LOGIC UNIT)

IC3 detects +5 voltage. When the +5 voltage line becomes 5 V, IC3 turns INTO "HIGH" and the CPU (IC1) restarts operation.

The CPU is reset when IC1 pin 76 becomes "HIGH." The AND gate IC (IC4) outputs a reset signal when both input terminals are "HIGH." One terminal is "HIGH" when the [MONI] switch is pushed and the other (INT0 line) is "HIGH" when the power is turned ON.

RESET CIRCUIT

Fig. 5

The indicator lights up in green as the busy indicator while the squelch opens using CPU pin 78 output via the inverter (Q2).
