# SECTION 5 CIRCUIT DESCRIPTION

## 5-1 RECEIVER CIRCUITS

This transceiver has two receiving lines called A\_BAND and B\_BAND for dualwatch capability. A\_BAND corresponds to FM/WFM/AM mode receiving within 0.495–999 MHz range, and B\_BAND corresponds to FM/FM-N/AM/DV mode receiving within 118–174 MHz and 350–470 MHz ranges.

### 5-1-1 RF CIRCUITS (RF UNIT)

This transceiver has six RF circuits to provide wide receiving range. The received signals from the antenna connector (CHASSIS; J1) are applied to each RF circuit for the frequency coverage, and amplified within the frequency coverage.

#### • While receiving 0.495–76 MHz

The received signals of 76 MHz and below are passed through the low-pass filter (LPF; L200, L201, C201–C204) via the two LPFs (L1–L3, C1–C6; L5–L7, C10–C14), attenuator (D10) and band switch (D200).

The 0.495–30 MHz band signals are passed through the band switch (D201), then applied to the RF amplifier (Q200) via the low-pass filter (L202, L203, C205–C209). The 30–76 MHz band signals are applied to the tuned RF amplifier (Q250, D252, D255) via the band switch (D250).

The amplified signals are applied to the A\_BAND 1st mixer (IC900, pin 1) via the band switches (D203 or D256, D707).

The amplified signals are applied to the A\_BAND 1st mixer (IC900, pin 1) via the band switches (D311, D707).

#### - 76–118 MHz or 174–260 MHz -

#### • While receiving 118–174 MHz

The 118–174 MHz band signals are passed through the two LPFs (L1–L3, C1–C6; L5–L7, C10–C14) and attenuator (D10), then applied to the RF amplifier (Q400) via the band switch (D400) and bandpass filter (BPF; L400, L405, C400, C401).

The amplified signals are applied to the tuned RF amplifiers for A\_BAND (Q401, D401–D403) and B\_BAND (Q450, D450–D452).

#### - 118–174 MHz -

#### • While receiving 260–350 MHz or 470–600 MHz

The 260–350 MHz and 470–600 MHz band signals passed through the LPF (L1–L3, C1–C6) and HPF (L4, C7–C9), then applied to the tuned RF amplifier (Q500, Q501, D502, D505, D506) via the attenuator (D7) and band switch (D500).

**• A\_BAND (0.495–999 MHz)**

The received signals from the RF circuits are applied to the A\_BAND 1st IF mixer (RF UNIT; IC900, pin 1), and converted into the 61.65 MHz (FM/AM)/59.25 MHz (WFM) 1st IF signal by being mixed with 1st Local Oscillator (LO) signals from the VCOs (VCO UNIT).

While receiving 0.495–76 MHz band signals, the 1st LO signals are generated at BC BAND VCO (VCO UNIT; Q1, D1, D3, D5, D6), and for receiving 76–260 MHz band signals, the 1st LO signals are generated at VHF BAND VCO (VCO UNIT; Q51, D51, D54).

While receiving 260–999 MHz band signals, the 1st LO signals are generated at UHF BAND VCO (VCO UNIT; Q101, D101, D104). If the receiving frequency is 600 MHz or higher, the VCO output signal is doubled at the doubler circuit (RF UNIT; Q850) before being applied to the 1st mixer (RF UNIT; IC900, pin 3).

In FM/AM mode, the converted IF signal is applied to the 1st IF filter (MAIN UNIT; F11) via the mode switch (D2) to filter out the unwanted signals, then applied to the IF amplifier (MAIN UNIT; Q100).

In WFM mode, the converted IF signal is applied to the 1st IF amplifier (MAIN UNIT; Q1) via the mode switch (D2). The amplified 1st IF signal is applied to the 2nd IF mixer (MAIN UNIT; Q2), and converted into the 13.35 MHz IF signal by being mixed with the 45.95 MHz Lo signal. The converted IF signal is passed through the IF filter (MAIN UNIT; F12) to filter out the unwanted signal, then applied to the IF amplifier (MAIN UNIT; Q100).

The amplified 1st or 2nd IF signal from the IF amplifier (MAIN UNIT; Q100) is then applied to the A\_BAND IF IC (MAIN UNIT; IC100, pin 16).

**• A\_BAND 1st IF CIRCUIT**

**• B\_BAND (118–174 MHz, 350–470 MHz.)**

While receiving 118–174 MHz band signals, the 1st LO signals are generated at B\_BAND VBVCO (MAIN UNIT; Q301, D300, D301), and for receiving 350–470 MHz band signals, the 1st LO signals are generated at B\_BAND UBVCO (MAIN UNIT; Q351, D350, D352).

The converted 1st IF signal is passed through the 1st IF filter (MAIN UNIT; F150) to filter out the unwanted signal, then applied to the 1st IF amplifier (MAIN UNIT; Q200). The amplified 1st IF signal is then applied to the B\_BAND IF IC (MAIN UNIT; IC200, pin 16).

The filtered AF signals are applied to the D/A converter (LOGIC UNIT; IC303 for A\_BAND; pins 21, 22; 23, 24/for B\_BAND; pins 13–16) and level adjusted. The level adjusted AF signals are applied to the AF power amplifier (LOGIC UNIT; IC550, pin 2). The power amplified AF signals are then output from pin 6, and applied to the internal speaker (CHASSIS; SP1) via [SP] connector (MAIN UNIT; J700).

5-1-5 AGC CIRCUIT (MAIN AND RF UNITS)

A portion of the AM-demodulated signals are converted into DC voltage by AGC (Automatic Gain Control) detector (MAIN UNIT; Q104; A\_BAND/Q203; B\_BAND), and fed back to the IF and RF circuits as the AGC signal.

• AF CIRCUITS

from the AM demodulator circuit (Q104, Q105)

from the A\_BAND IF IC (IC100, pin 9)

from the B\_BAND IF IC (IC200, pin 9)

from the AM demodulator circuit (Q203, Q204)

MAIN UNIT

LOGIC UNIT

The AGC signal controls the bias of the IF amplifiers (MAIN UNIT; Q100, Q103/Q200, Q202) and RF amplifiers (RF UNIT; Q200, Q250, Q300, Q301, Q401, Q500, Q501, Q601/Q700, Q701, Q450, Q651) according to the received signal strength to prevent audio distortion and stabilize the demodulated AF signal level.

## 5-1-6 SQUELCH CIRCUITS (MAIN AND LOGIC UNITS)

### • NOISE SQUELCH

The noise squelch mutes the AF output signals when no RF signals are received. By detecting noise components in the demodulated AF signals, the squelch circuit toggles the AF power amplifier ON and OFF.

A portion of the FM-demodulated AF signals from the IF IC (MAIN UNIT; IC100/IC200 (A\_BAND/B\_BAND), pin 9) is passed through the noise filter (MAIN UNIT; IC100/IC200, pins 7, 8, R109–R113, C118–C122/R212–R216, C218–C222). The filtered noise signals are then applied to the noise amplifier in the IF IC to be amplified the noise components only.

The amplified noise components are converted into the pulse-type signal at the noise detector section, and output from pin 13 as the noise signal (A\_BAND: "ANOIS"/B\_BAND: "BNOIS"). The noise signal is applied to the CPU (LOGIC UNIT; IC1, pin 26/28), then the CPU outputs "AFON" signal from pin 97 according to the noise detection signal level to toggle the AF power amplifier regulator (LOGIC UNIT; Q105, Q106) ON and OFF.

### • TONE SQUELCH

The tone squelch detects the tone signal in the demodulated AF signals, and opens the squelch only when matched subaudible tone frequency is detected in the received signal.

While the tone squelch is in use, and the received signal contains no sub-audible tone signal or mismatched tone frequency, the tone squelch mutes the AF signals even if the noise squelch is open.

A portion of the demodulated AF signals from the IF IC (MAIN UNIT; IC100/IC200, pin 9) are passed through the two-staged CTCSS/DTCS filter (MAIN UNIT; IC150/IC250, pins 3, 1 and pins 5, 7) via the mode switch (MAIN UNIT; IC500, pins 1, 2/10, 11) to suppress unwanted voice signals. The filtered CTCSS/DTCS signals (A\_BAND: "ATONE"/B\_BAND: "BTONE") are applied to the CPU (LOGIC UNIT; IC1, pin 49/45) via the tone selector (MAIN UNIT; IC703, pins 3, 4/10, 11).

The CPU decodes the CTCSS/DTCS signal, and outputs "AFON" signal from pin 97 according to the set CTCSS/DTCS signal to toggle the AF power regulator (LOGIC UNIT; Q105, Q106) ON and OFF.

## 5-2 TRANSMITTER CIRCUITS

### 5-2-1 MICROPHONE AMPLIFIER CIRCUIT (LOGIC UNIT)

The microphone amplifier circuit contains AF amplifier, IDC, splatter filter, etc. The AF signals from the microphone (thereafter, it is called "MIC signals") are filtered and level-adjusted at this circuit.

MIC signals from the microphone (MC300) are applied to the MIC amplifier (Q302), then the amplified MIC signals are applied to the mode switch (IC301, pin 1). In FM mode, the MIC signals are output from pin 6 and applied to the IDC (Instantaneous Deviation Control; IC302, pin 5).

In DV mode<sup>†</sup>, the MIC signals are output from pin 7 and applied to the IDC (IC302, pin 5) via the ALC amplifier (IC300, pins 3, 5).

The IDC limits the level of the amplitude of MIC signals to prevent over deviation. The limited MIC signals are output from pin 7 and passed through the splatter filter (IC302, pins 8, 9).

The splatter filter suppresses 3 kHz and higher audio components.

The filtered MIC signals are applied to the D/A converter (IC303, pin 1) via the mode switch (IC304, pins 10, 11). The D/A converter (IC303) adjusts the deviation according to "DATA" signal from the CPU (IC1, pin 30).

The level adjusted MIC signals are output from pin 2 and then applied to the modulation circuit (VCO UNIT; D55 or D100) to modulate the VCO oscillating signal.

### • MICROPHONE AMPLIFIER CIRCUIT

### 5-2-2 MODULATION CIRCUIT (VCO UNIT)

The modulation circuit modulates the VCO oscillating signal with the AF signals from the microphone and the tone signals from the CPU.

### • MICROPHONE SIGNALS

The level adjusted MIC signals from the D/A converter (LOGIC UNIT; IC303, pin 2) are applied to the D55 (in transmitting on 144 MHz band) or D100 (in transmitting on 430 MHz band) to modulate the VCO oscillating signal by changing the reactance of D55 or D100. The modulated VCO output signal is buffer-amplified by Q200 and Q201, then applied to the transmit amplifiers via TX/RX switch (RF UNIT; D100) and amplifier (RF UNIT; IC100, pins 1, 4), as a transmit signal.

### • TONE SIGNALS

The CTCSS and DTCS signals are generated by the CPU (LOGIC UNIT; IC1) and output from pin 43.

The CTCSS/DTCS signals are passed through the tone filter (Q307, R338–R340, C339, C340). The filtered tone signals are mixed with the MIC signal coming from the IDC amplifier (LOGIC UNIT; IC302 pin 7), then applied to the modulation circuit via the splatter filter, mode switch and D/A converter.

The CTCSS/DTCS signals are passed through the tone filter (Q307, R338–R340, C339, C340). The filtered tone signals are mixed with the MIC signals come from the IDC amplifier (LOGIC UNIT; IC302, pin 7), then applied to the modulation circuit (D55 or D100) via the splatter filter (LOGIC UNIT; IC302, pins 9, 8), mode switch (LOGIC UNIT; IC304, pins 11, 10) and D/A converter (LOGIC UNIT; IC303, pins 4, 3).

### 5-2-3 TRANSMIT AMPLIFIERS (RF UNIT)

The VCO output signal is amplified to transmit output power level by the transmit amplifiers.

The VCO output signal from the amplifier (IC100) is applied to the pre-driver (Q102), driver (Q101) and power (Q100) amplifiers in sequence to be amplified to the transmit output power level. The power amplified transmit signal is passed through the antenna switching circuit and transmit filters.

<sup>†</sup>Available for IC-91AD or when the optional UT-121 is installed into IC-91A.

### 5-2-4 APC CIRCUIT (RF UNIT)

The APC (Automatic Power Control) circuit stabilizes transmit output power and controls it High or Low. The APC of this transceiver is a current monitoring type that detects the transmit signal current of the transmit amplifiers and controls the transmit output power.

While transmitting, the voltage drop in R161 is detected by the current detection circuit (Q150) and applied to the APC controller (IC150, pin 6). Also, "PSET" signal (power setting reference voltage) from the D/A converter (IC950, pin 19) is applied to another input (pin 5).

Then the voltage difference between pins 5 and 6 is output from pin 7, and the transmit output power is controlled by varying of the gate voltage of the power amplifier (Q100).

When the transmit output power is set to Low, the driver gate voltage "DSET" is controlled at the same time as the power setting reference voltage "PSET" and the dynamic range of the power control is ensured. Thus, the APC circuit maintains a constant transmit output power.

#### • APC CIRCUIT

### 5-2-5 TRANSMIT FILTERS (RF UNIT)

The power amplified transmit signal from the power amplifier is filtered at the transmit filters. The transmit filters prevent unwanted RF signals being emitted to the air.

While transmitting in 144 MHz band, the power amplified transmit signal is passed through the LPF (L102, L103, C106, C107), antenna switch (D8) and two LPFs (L5-L7, C10-C14; L1-L3, C1-C6) before being applied to the antenna connector (CHASSIS; J1).

### 5-3-2 PLL CIRCUITS (RF AND MAIN UNITS)

The PLL circuit provides stable oscillation of the transmit frequency and receive 1st LO frequency. The PLL circuit compares the phase of the divided VCO frequency with the reference frequency. The PLL output frequency is controlled by the divided ratio (N-data) from the CPU.

#### • A\_BAND PLL CIRCUIT

The applied signals are divided at the prescaler and OSC counter according to the "PLLDATA" signal from the CPU (LOGIC UNIT; IC1, pin 94). The divided signal is phase compared with the reference frequency at the phase detector.

The phase difference is output from pin 2 as a pulse type signal after being passed through the internal charge pump. The output signal is applied to the BC/VHF/UHF BAND VCOs (VCO UNIT) after being converted into the DC voltage (lock voltage) at the loop filter (RF UNIT; C820–C823, R806–R808).
