## INTRODUCTION

This service manual describes the latest service information for the **IC-737A** HF TRANSCEIVER at the time of publication.

VERSION NO.	VERSION	SYMBOL
#01	Other	OTH
#02	France	FRA

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

## DANGER

**NEVER** connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

**DO NOT** expose the transceiver to rain, snow or any liquids.

**DO NOT** reverse the polarities of the power supply when connecting the transceiver.

**DO NOT** apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

## ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

### <SAMPLE ORDER>

1790000050 IC ND487C1-3R IC-737A MAIN UNIT 5 pieces  
8810002260 Screw FH B0 M3×6 IC-737A Chassis 10 pieces

Addresses are provided on the inside back cover for your convenience.

## REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 50 dB to 60 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

## SECTION 1 SPECIFICATIONS

### ■ GENERAL

- Frequency coverage : Receive 500 kHz-29.995 MHz  
Transmit 1.800-1.99999 MHz 3.500-4.000 MHz  
7.000-7.300 MHz 10.100-10.150 MHz  
14.000-14.350 MHz 18.069-18.168 MHz  
21.000-21.450 MHz 24.890-24.990 MHz  
28.000-29.700 MHz
- Mode : SSB, CW, AM, FM
- Number of memory channels : 101
- Antenna impedance : 50  $\Omega$  nominal
- Usable temperature range :  $-10^{\circ}\text{C}$  to  $+60^{\circ}\text{C}$  ( $+14^{\circ}\text{F}$  to  $+140^{\circ}\text{F}$ )
- Frequency stability : Less than  $\pm 200$  Hz from 1 min. to 60 min. after power ON  
Less than  $\pm 30$  Hz/hr. after one hour at  $+25^{\circ}\text{C}$  ( $+77^{\circ}\text{F}$ )  
Temperature fluctuations ( $0^{\circ}\text{C}$  to  $+50^{\circ}\text{C}$ ;  $+32^{\circ}\text{F}$  to  $+122^{\circ}\text{F}$ ) less than  $\pm 350$  Hz
- Power supply requirement : 13.8 V DC  $\pm 15\%$  (20 A)
- Current drain (at 13.8 V DC) : Transmit 20 A  
Receive squelched 1.6 A  
max. audio output 2.1 A
- Dimensions : 330 (W)  $\times$  111 (H)  $\times$  285 (D) mm  
13.0 (W)  $\times$  4.4 (H)  $\times$  11.2 (D) in  
(Projections not included)
- Weight : 8.1 kg (17.9 lb)

### ■ TRANSMITTER

- Output power : SSB, CW, FM 10-100 W  
AM 10-40 W  
(continuously adjustable)
- Spurious emissions : Less than  $-50$  dB
- Carrier suppression : More than 40 dB
- Unwanted sideband suppression : More than 50 dB
- Microphone impedance : 600  $\Omega$

### ■ RECEIVER

- Receive system : Triple-conversion superheterodyne
- Intermediate frequency :
 

MODE	1st	2nd	3rd
SSB	69.0115 MHz	9.0115 MHz	455 kHz
CW	69.0106 MHz	9.0106 MHz	455 kHz
AM, FM	69.0100 MHz	9.0100 MHz	455 kHz
- Sensitivity (Preamp ON) : SSB, CW (10 dB S/N) 1.8-29.995 MHz Less than 0.16  $\mu\text{V}$   
AM (10 dB S/N) 0.5-1.8 MHz Less than 13.0  $\mu\text{V}$   
1.8-29.995 MHz Less than 2.0  $\mu\text{V}$   
FM (12 dB SINAD) 28-29.7 MHz Less than 0.5  $\mu\text{V}$
- Squelch sensitivity (Threshold) : SSB Less than 5.6  $\mu\text{V}$   
FM Less than 0.3  $\mu\text{V}$
- Selectivity : SSB, CW More than 2.1 kHz/ $-6$  dB Less than 4.0 kHz/ $-60$  dB  
AM More than 6.0 kHz/ $-6$  dB Less than 20.0 kHz/ $-40$  dB  
FM More than 12.0 kHz/ $-6$  dB Less than 30.0 kHz/ $-50$  dB
- Spurious and image rejection ratio : More than 70 dB
- Audio output power : More than 2.6 W with an 8  $\Omega$  load
- RIT variable range :  $\pm 1.25$  kHz or  $\pm 2.5$  kHz selectable

### ■ ANTENNA TUNER

- Matching impedance range : 16.7-150  $\Omega$  unbalanced (less than VSWR 3 : 1)
- Minimum operating input : 8 W
- Waiting time for band changing : Less than 3 sec.  
(typical)
- Tuning time (typical) : Less than 7 sec.
- Tuning accuracy : VSWR 1.5 : 1 or less
- Insertion loss (after tuning) : Less than 1.0 dB

All stated specifications are approximate and subject to change without notice or obligation.

## SECTION 2 DISASSEMBLY INSTRUCTIONS

### 2-1 REMOVING THE PA BLOCK

1. Remove 19 screws (black, 8 mm) as shown in Fig. 1, to remove top and bottom covers.

Fig. 1

2. Remove 3 screws (A), 4 screws (B) and 2 screws (C) as shown in Fig. 2.

3. Unplug 1 coaxial cable (J11), 3 connectors (J6, J13 and J34) from the MAIN unit as shown in Fig. 6 (p. 2-3).

4. Unplug 1 coaxial cable (J20) from the CTRL unit as shown in Fig. 6 (p. 2-3).

Fig. 2

5. Pull the front panel forward.
6. Unplug 2 connectors (6-pin connector from P13 and 3-pin connector from Q1) as shown in Fig. 3.
7. Remove the PA block as shown in Fig. 3.

Pay attention to connector orientation when reconnecting to Q1.

Fig. 3

## 2-2 REMOVING THE ANTENNA TUNER

1. Remove 3 screws ① and 6 screws ② as shown in Fig. 4.
2. Unplug 1 coaxial cable (J19) and 4 connectos (J7, J15, J16 and J17) from the CTRL unit as shown in Fig. 6. (p. 2-3).

Fig. 4

3. Shift the rear panel backward and remove the antenna tuner as shown in Fig. 5.

Fig. 5

2-3 CONNECTOR LOCATIONS

Fig. 6

## SECTION 4 CIRCUIT DESCRIPTION

### 4-1 RECEIVER CIRCUITS

#### 4-1-1 RF SWITCHING CIRCUIT (ANT-SW AND MAIN UNITS)

The RF switching circuit leads receive signals to bandpass filters from an antenna connector while receiving. While transmitting, this circuit leads the signals from the RF power amplifier to the antenna connector. This circuit includes a 20 dB RF attenuator circuit to prevent distortion from very strong signals.

RF signals from an antenna connector, switched by the [ANT] switch, pass through the transmit/receive switching relay (RL1) and low-pass filter (L1, L2, C1-C5), and are then applied to the MAIN unit via P2 (MAIN unit: J12).

The signals from the ANT-SW unit are either bypassed or are attenuated at the 20 dB attenuator (R102, RL1). There are no non-linear components from the antenna connector to the attenuator in this circuit construction. Therefore the attenuator effectively prevents distortion caused by strong signals. The signals are then applied to RF filters.

#### 4-1-2 RF BANDPASS FILTER CIRCUIT (MAIN UNIT)

RF bandpass filters pass only the desired band signals and suppress any undesired band signals.

The RF circuit has 7 RF bandpass filters (BPF) for signals above 1.6 MHz and 1 low-pass filter (LPF) for signals below 1.6 MHz. The signals pass through the low-pass or one of the bandpass filters depending on their frequencies.

##### (1) 0.5-1.6 MHz

There is no diode at the low-pass filter (L38, L39, C148-C150) entrance so as to prevent distortion from very strong signals. The filtered signals bypass the preamplifier through a bypass switch (Q12) and are then applied to the 1st mixer circuit (Q13, Q14).

##### (2) 1.6-30.0 MHz

These signals pass through a high-pass filter (L42, L43, C143-C146) to suppress strong signals below 1.6 MHz, such as from broadcasting stations. The filtered signals are applied to one of 7 bandpass filters depending on their frequencies and are then applied to the preamplifier circuit.

#### USED RF FILTER

BAND	CONTROL SIGNAL	ENTRANCE DIODE	BAND	CONTROL SIGNAL	ENTRANCE DIODE
0.5-1.6 MHz	B0	-	8-11 MHz	B4	D44
1.6-2 MHz	B1	D38	11-15 MHz	B5	D46
2-4 MHz	B2	D40	15-22 MHz	B6	D48
4-8 MHz	B3	D42	22-30 MHz	B7	D50

#### 4-1-3 PREAMPLIFIER CIRCUIT (MAIN UNIT)

The preamplifier circuit uses two 2SK937s to obtain 10 dB gain over a wideband frequency range. When the [PRE AMP] switch on the front panel is turned ON, the signals above 1.6 MHz are applied to the preamplifier circuit.

Q8 and Q9 are connected in parallel to easily match the impedance to 50 Ω. Q10 and Q11 switch the signals from a bandpass filter, either to be bypassed, or to be applied to the preamplifier, depending on the [PRE AMP] switch condition.

Amplified or bypassed signals are applied to the 1st mixer circuit (Q13, Q14).

#### PREAMP CIRCUIT

#### 4-1-4 1ST MIXER CIRCUIT (MAIN UNIT)

The 1st mixer circuit mixes the receive signals with the 1st LO signal to convert the receive signal frequencies to a 69 MHz 1st IF.

The signals from the preamplifier circuit, or signals which bypass the preamplifier, pass through a low-pass filter. This low-pass filter suppresses signals above 30 MHz to eliminate direct receiving of signals at 69 MHz and image interference at 140 MHz. The signals are then applied to the 1st mixer (Q13, Q14).

The 1st LO signal (69.0600-99.0115 MHz) enters the MAIN unit from the PLL unit via J5. The LO signal is amplified at Q4, filtered by a low-pass filter, and then, applied to the 1st mixer. The low-pass filter uses a ring core inductor to prevent leakage of 1st LO signals. The output level from Q4 is approx. 15 dBm.

The 1st mixer (Q13, Q14) uses two 2SK937s to produce high level mixing with a high intercept point.

#### EXACT 1ST IF FREQUENCY

MODE.	FREQUENCY (MHz)
SSB	69.0115
CW	69.0106
AM, FM	69.0100

### 4-1-5 1ST IF CIRCUIT (MAIN UNIT)

The 1st IF circuit filters and amplifies the 1st IF signals. The 1st IF signals from the 1st mixer circuit are applied to MCF (Monolithic Crystal Filter; F11) to suppress out-of-band signals. The filtered signals are applied to the 1st IF amplifier (Q15). AGC voltage is supplied to the 2nd gate of Q15.

### 4-1-6 2ND MIXER CIRCUIT (MAIN UNIT)

The 2nd mixer circuit mixes the amplified 1st IF signals and 2nd LO signal (60.00 MHz) to convert the 1st IF to a 2nd IF.

The amplified 1st IF signals from Q15 are converted to 9 MHz 2nd IF signals at the 2nd mixer (IC1). IC1 is a DBM (Double Balanced Mixer). The DBM uses a coil with a glass-type core to treat the LO signal at a 0 dBm level.

The 2nd IF signals are applied to FI2 to suppress undesired signals such as the 2nd LO signal, and are then applied to the noise blanker gate (D5–D8).

#### EXACT 2ND IF FREQUENCY

MODE	FREQUENCY (MHz)
SSB	9.0115
CW	9.0106
AM, FM	9.0100

### 4-1-7 NOISE BLANKER CIRCUIT (MAIN UNIT)

The noise blanker circuit detects pulse type noise, and turns OFF the signal line when noise appears.

The 2nd IF signals from FI2 are applied to the noise blanker gate (D5–D8). A portion of the signals from FI2 are amplified at the noise amplifiers (Q16, IC2, Q74), then detected at the noise detector (D12, D13). The detected signal from the noise detector is applied to the noise blanker switch (Q19).

#### NOISE BLANKER CIRCUIT

A portion of the detected signal from the noise detector is applied to the noise AGC circuit (Q17, Q18, C60, R43, R47) to control the bias voltage of the noise amplifier (IC2 pins 1, 2).

The threshold level of the noise blanker switch (Q19) is set at 0.9 V. When the detected voltage exceeds the threshold level, Q20 outputs a blanking signal to close the noise blanker gate (D5–D8), depending on the pulse noise period.

When the operating frequency is changed, the “DNB” signal line becomes “LOW,” turning Q20 ON through D14. In this case, the noise blanker gate prevents PLL click noise.

### 4-1-8 2ND IF CIRCUIT (MAIN UNIT)

The 2nd IF circuit amplifies and filters the 2nd IF signals.

The signals passed through the noise gate (D5–D8) are amplified at Q21. The Loose tuning circuit (L24, C47) matches the signals to the 2nd IF filters.

When SSB or CW mode is selected, the signals pass through FI3 (FL-30). When an optional CW narrow filter is installed and CW-N mode is selected, the signals pass through the CW narrow filter. When AM mode is selected, the signals bypass the 2nd IF filter. When FM mode is selected, the signals are applied to the FMAM unit via the FIF signal line.

The filters are selected with mode selecting signals (SSB·CW, AM, CW-N) and the “T8” voltage line.

Signals from the filters are applied to the 3rd mixer (IC7) through D63.

### 4-1-9 3RD MIXER AND 3RD IF CIRCUITS (MAIN UNIT)

The 3rd mixer circuit mixes the filtered 2nd IF signals and the 3rd LO signal to convert the 2nd IF to a 3rd IF.

The 2nd IF signals from D63 are converted to a 455 kHz 3rd IF signal at the 3rd mixer (IC7). The 3rd IF signal is applied to FI4 (for AM mode) or FI5 (for SSB and CW mode). The filters are selected by the mode selecting signals. The filtered signal is amplified at Q27, Q28 and Q29 to obtain a detectable level.

A rapid time constant of AGC is used for Q27 to prevent rising edge distortion of receive signals. A thermistor (R419), connected to the gate of Q28, improves the temperature characteristics of the receiver gain. R138 adjusts the receiver gain. Q76 mutes the IF signal from Q28 until the R8 voltage line becomes 8 V DC. This prevents unwanted signal reception, especially during CW full break-in operation.

Output signals from Q28 are applied to the SSB/CW detector. Output signals from Q29 are shared between the AM detector and AGC detector.

### 4-1-10 BFO CIRCUIT (MAIN UNIT)

A 9 MHz signal oscillated at the BFO circuit (Q31, X1) is buffer-amplified at Q42 and applied to the balanced modulator (IC6) for transmission, and to a product detector (IC5) after mixing with the 3rd LO signal at IC12 for receive demodulation.

In USB mode, the "USB" signal line becomes "HIGH," turning D69 ON. The frequency is then adjusted with C294 to set the USB carrier point.

During CW transmission, the "CW" signal line becomes "HIGH," turning D68 ON. The frequency is then adjusted with L83 to set the CW transmit carrier point.

In LSB mode, the "LSB" signal line becomes "HIGH," turning D67 ON. The frequency is then adjusted with L82 to set the LSB carrier point.

During CW reception, R8 voltage turns Q33 ON, then switching diodes (D67-D69) are turned OFF. The frequency is fixed by coils (L81-L83) and capacitors (C294, C230).

### BFO FREQUENCY IN EACH MODE

MODE	FREQUENCY (MHz)
USB	9.0130
CW (Tx)	9.0106
LSB	9.0100
CW (Rx)	9.0098
AM, FM	NO OUTPUT

### 4-1-11 PBT CIRCUIT (MAIN UNIT)

The PBT (PassBand Tuning) circuit shifts the 3rd IF within  $\pm 1.5$  kHz. As a result, the 3rd IF is shifted from the center frequency of the 3rd IF filter (FI5). This means the 3rd IF signal does not pass through the center of the 3rd IF filter because the passband width is fixed in the 2nd IF filter. Therefore, the overlap of the 2nd and 3rd IF filters appears to be narrowed.

Since the BFO frequency is also shifted the same value as the 3rd IF shift, frequency is corrected at the detector.

The 3rd LO signal to IC7 is produced by Q57 and X2. In SSB mode, the signal is shifted within  $\pm 1.5$  kHz by D101 variable voltage which is controlled by the [PBT] control. Therefore, the 3rd LO signal is shifted to activate the PBT.

In AM mode, D101 variable voltage is replaced with a preset voltage by Q62 and 9.4650 MHz is output regardless of the [PBT] control location.

In CW mode, D101 variable voltage is replaced with a preset voltage by Q60 and 9.4656 MHz is output regardless of the [PBT] control location.

### PBT CIRCUIT

### 4-1-12 SSB/CW DEMODULATOR CIRCUITS (MAIN UNIT)

In SSB or CW mode, the 3rd IF signal from the IF amplifier (Q28) is mixed with the BFO signal from IC12 at the product detector (IC5) to demodulate the 3rd IF signal into an AF signal. The detected signal (AF) from IC5 (pin 3) is applied to the AF input mode selector switch (IC8).

### 4-1-13 AM DEMODULATOR CIRCUITS (MAIN UNIT)

In AM mode, the 3rd IF signal from the buffer amplifier (Q29) passes through C121 and is detected at D62. The detected signal (AF) is then applied to the AF input mode selector switch (IC8).

### 4-1-14 FM DEMODULATOR CIRCUIT (FMAM UNIT)

In FM mode, the 2nd IF signal, just before passing the 2nd IF filter, is applied to the FMAM unit via D52. The passed signal is applied to the FM IF IC where the IF signal is converted into the 3rd IF signal and is then converted into an AF signal.

X1 and X2 on the FMAM unit are used for the 3rd local oscillator and quadrature detector, respectively.

The detected signal (AF) is then applied to the AF input mode selector switch (IC8) on the MAIN unit.

### 4-1-15 AF INPUT MODE SELECTOR SWITCH (MAIN UNIT)

The AF signal from one of the detector circuits is applied to the AF input mode selector switch (IC8). IC8 consists of 4 analog switches which are selected with a mode signal and the squelch control signal. The AF signal is output from IC8 (pins 1, 4, 11) and then applied to the AF notch circuit.

### AF CIRCUIT

### 4-1-16 AGC CIRCUIT (MAIN UNIT)

The AGC (Automatic Gain Control) circuit reduces IF amplifier gain to keep the audio output at a constant level.

The receiver gain is determined by the voltage on the AGC line (Q30, collector). The voltage is usually set by D58 and the resistance ratio of R121, R122, R315 and R316.

The 3rd IF signal from the buffer amplifier (Q29) is detected at the AGC detector (D59, D60) and is then applied to the DC amplifier (Q30). - 5 V is applied to the Q30 emitter to activate the AGC line on the minus voltage.

When receiving strong signals, the detected voltage increases and the voltage of the AGC line decreases via the DC amplifier (Q30). As the AGC line is used for the bias voltage of the IF amplifiers (Q15, Q21, Q27), IF amplifier gain is decreased.

When the strong signal disappears, the AGC line voltage is released by C113 and R120 while fast AGC is set. When slow AGC is set, C112 and R119 are connected in parallel to obtain a slow AGC release time.

### AGC CIRCUIT

### 4-1-17 S-METER CIRCUIT (MAIN UNIT)

The S-meter circuit indicates the relative received signal strength while receiving by utilizing the AGC voltage which is changed depending on the received signal strength.

The AGC bias voltage (time constant line) is applied to a differential amplifier (IC4 pin 6) where the difference between the bias and reference voltages is detected.

The resulting S-meter signal passes through the meter switching circuit (IC8) and is then applied to the S/RF meter on the front panel. The reference voltage is adjusted with R116. IC8 (pins 8 and 9) are shorted inside the IC while receiving.

The FM S-meter signal from the FMAM unit is applied to the meter switching circuit (IC8 pin 9) via the "FSM" signal line. The signal is also applied to the squelch circuit (IC4 pin 2).

**4-1-18 SQUELCH CIRCUIT (MAIN UNIT)**

The squelch circuit mutes audio output when the S-meter signal is lower than the [SQL] control setting level.

The S-meter signal (SSB, CW, AM) from IC4 (pin 7) is applied to the comparator (IC4 pin 2) through D56 to be compared with the threshold level set by the [SQL] control.

In FM mode, the 3rd IF signal is amplified and detected at IC2 and D3/D4, respectively, in the FMAM unit. The detected signal (S-meter signal) is then applied to the comparator (IC4 pin 2).

When the S-meter signal is lower than the threshold level, the comparator becomes "HIGH" and Q32 turns OFF to deactivate the AF input mode selector switch (IC8 pins 5, 12, 13). This cuts AF output OFF. This signal is then applied to Q34, turning OFF the [RX] indicator, and is also applied to the [MICROPHONE] connector (pin 4) and [ACC(1)] connector (pin 6).

**4-1-19 AF NOTCH CIRCUIT (NOTCH BOARD)**

The notch circuit attenuates the specified audio frequency to increase readability of desired signals.

The AF signal from the AF input mode selector switch (IC8) is applied to the AF notch circuit via an analog switch (IC2). IC2 and IC3 are analog switches which either select the AF signal to the notch circuit or bypass the notch circuit.

The signal is then applied to an active bandpass filter (IC1a), which has very narrow width characteristics, to pick up the interference frequency in reverse phase. The resulting signal is mixed with the original signal at R8 to obtain approx. 20 dB attenuation of the interference frequency components.

The center frequency can be adjusted with the [NOTCH] control. IC1b functions as a buffer amplifier.

**4-1-20 AF AMPLIFIER CIRCUIT (NOTCH BOARD AND MAIN UNIT)**

The AF amplifier amplifies the AF input signal to a suitable driving level for the speaker.

The AF signal from the AF notch circuit is applied to the AF preamplifiers (NOTCH board Q1, Q2). The CW side tone signal is applied to Q2.

The amplified signal is applied to the [AF] control (R1 on the AF unit) and then to the 2.8 kHz cut-off active low-pass filter (Q37). The AF signal output from Q37 is power-amplified at IC9 to drive the speaker.

**4-2 TRANSMITTER CIRCUITS**

**4-2-1 MICROPHONE AMPLIFIER CIRCUIT (PLL AND AF UNITS)**

The microphone amplifier circuit amplifies the microphone input signals and outputs the amplified signal to the balanced modulator and FMAM unit. The speech compressor circuit is included in this circuit.

Audio signals from the [MICROPHONE] connector are amplified at Q604 (PLL unit) and then Q2 (AF unit). The amplified signals are then adjusted at the [MIC] control and amplified again at Q1 (AF unit). External modulation input from the [ACC(1)] socket (pin 4) is also applied to Q1 via R5 (AF unit).

When the speech compressor is ON, the gain of Q2 increases and the diode limiter (AF unit D1, D2) is activated. The compression level is set by R17 (DISPLAY unit).

**AF NOTCH CIRCUIT (NOTCH BOARD)**

#### 4-2-2 VOX CIRCUIT (PLL UNIT)

The microphone signal from Q604 is amplified at Q603 and passed through the [VOX GAIN] control (R601). The signal is then applied to the VOX comparator (IC601a) to switch the "FUL2" line via Q601 and D601. When voice levels exceed the comparator level, the VOX circuit sets the transceiver to transmit.

On the other hand, a speaker drive signal from the JACK unit is applied to the ANTI-VOX comparator (IC601b) via the [ANTI-VOX] control (R602). When audio output level increases, this comparator cuts out the VOX comparator input.

#### 4-2-3 BALANCED MODULATOR (MAIN UNIT)

The balanced modulator converts the AF signal from the microphone amplifier to a 9 MHz IF signal with a BFO signal.

Output signals from the microphone amplifier and the CW keying signal are applied to the balanced modulator (IC6 pin 5). The BFO signal, buffer-amplified at Q42, is applied to IC6 (pin 7) as a carrier signal.

IC6 is a double balanced mixer IC and outputs a double side band (DSB) signal with -40 dB carrier suppression.

R177 and R179 adjust the balanced level of IC6 for maximum carrier suppression. In CW mode, the CW keying signal upsets the balance to create a carrier signal.

#### 4-2-4 FM AND AM MODULATION CIRCUITS (FMAM UNIT)

The microphone signals from the AF unit enter the FM•AM unit via P2 (FMI2 line) and are then amplified at Q11 and the limiter amplifier/low-pass filter (IC5a/b).

In FM mode, the microphone signals are applied to the modulation circuit (D8) via R42. The modulation circuit changes the reactance of the FM local oscillator (Q1, X3) to obtain FM modulation. The modulated signal is amplified at IC3 and IC4 and is then applied to the transmitter IF circuit (MAIN unit Q22).

In AM mode, the microphone signals are applied to the local oscillator amplifier (IC4) via R44 as bias voltages to obtain AM modulation.

#### 4-2-5 CW KEYING CIRCUIT (MAIN UNIT)

The CW keyer is connected to Q38. When the CW key is closed, 8 V is output from Q38 and this voltage controls break-in operation, the side tone signal and the transmit signal.

The 8 V from Q38 is applied via D93 to the balanced modulator (IC6) to unbalance the IC6 input bias voltage and create a carrier signal. R241 determines the transmit delay timing.

#### (1) BREAK-IN

When the [BK-IN] switch (S3 in the DISPLAY unit) is pushed IN, the IC-737A is automatically set to the transmission condition by CW keying. The 8 V from Q38 is applied to Q52 base via Q26. When the key is closed, Q52 grounds the SEND line for transmitting.

The transmit release delay time is determined by C252, R245 and the [DELAY] control (R244). When the [FULL] switch (S4 in the DISPLAY unit) is pushed IN, R425 is connected in parallel to obtain faster release time.

#### (2) SIDE TONE

When the CW key is closed, the side tone circuit (Q40) oscillates and sends the signal to the AF circuit.

Normally, D91 is ON, and C249 is connected to the Q40 collector so that no oscillation occurs. When the CW key is closed, the 8 V from Q38 via D92 give D91 reverse bias to disconnect C249 from Q40. Q40 then oscillates with 800 Hz as a side tone signal. R268 prevents side tone click noise.

#### (3) KEYING

Keying is controlled at 2 points in the IC-737A. The balanced mixer (IC6) stops the carrier output by recovering the balance of the input bias voltage. D35, located at the 2nd IF mixer (IC1) input, cuts the signal line.

C251, R240 and R241 determine the voltage wave form to IC6 (pin 5) to make the keying wave form.

#### (4) ELECTRONIC KEYS (PLL UNIT)

When a paddle is connected to the [KEY] jack and the [ELEKEY] switch (MAIN unit S2) is pushed IN, a "DOT" or "DASH" signal is applied to the electronic keyer IC (IC501).

The CW keying speed is adjusted with the [KEY SPEED] control (AF unit R2). The ratio of DOT:SPACE:DASH (keying weight) can be adjusted from 1:1:3 to 1.8:1:3.8 with R8.

IC501 (pin 7) outputs the keying signal in adjusted CW keying speed and weight, and the keying signal is then applied to Q38 in the MAIN unit.

#### 4-2-6 IF AMPLIFIER (MAIN UNIT)

The SSB/CW 9 MHz IF signal passes through the F13 (FL-30) to suppress the unwanted sideband signal, then the signal is applied to a transmit IF amplifier (Q22). The optional CW narrow filter is not used in transmitting.

The amplified signal from Q22 is mixed with the 2nd LO signal and converted to a 69 MHz IF signal at IC1. IC1 is used in receiving and transmitting. The FM/AM signal from the FMAM unit is also amplified at Q22 and is then applied to IC1.

The 69 MHz IF signal is amplified at the IF amplifier (Q7) and is then converted to the displayed frequency at the balanced mixer (Q2, Q3) with the 1st LO signal.

When the "REF" signal level increases, Q56 decreases the POC line voltage via R205. The POC line voltage is applied to IC11 to activate the ALC.

For the IC APC, the power transistor current is obtained by detecting the voltages ("ICH" and "ICL") which appear at both terminals of a 0.012 Ω resistor (R26 on the PA unit). The detected voltage is applied to the differential amplifier (IC10 pins 5, 6). When the current of the final transistors is more than 22 A, IC10 controls the ALC line via D73 to prevent excessive current flow.

Q55 is used for power reduction to prevent excessive current flow, when transmitting on the 28 MHz band, using the ALC line.

During tuning an antenna with an optional AH-3, the "PODN" signal turns Q75 ON. As a result, the "POC" voltage is shifted for 12 W output power.

### 4-2-11 TEMPERATURE PROTECTION CIRCUIT (PA UNIT)

A cooling fan (MF1) is activated while transmitting or if the temperature of Q5 or Q6 exceeds the preset value.

While transmitting, Q7 and Q8 are turned ON and provide a voltage to MF1 via R29. Thermistor R32 detects the temperature of Q5. If the Q5 temperature is more than 50°C (122 °F), R32 keeps turning Q7 and Q8 ON to rotate the cooling fan even when the transceiver condition has changed from transmitting to receiving.

A thermal switch (S1) is thermally-connected to Q6. When the Q6 temperature exceeds 90°C (194 °F), S1 is turned ON and provides a voltage for high speed rotation to MF1 via R28.

### 4-2-12 RF METER CIRCUIT (MAIN UNIT)

The "FOR" voltage from the FILTER unit is applied to the Po meter amplifier (IC10 pin 3). The amplified voltage is output from IC10 (pin 1) and then applied to the meter. R186 adjusts the meter sensitivity and R189 and C261 are used for RF meter peak power hold.

## 4-3 PLL CIRCUITS

### 4-3-1 GENERAL DESCRIPTION

The PLL unit generates a 1st LO signal (69.0600–99.0115 MHz variable) and a 2nd LO signal (60.00 MHz fixed is used for the MAIN unit). The IC-737A uses a dual loop PLL system.

The main loop PLL contains 4 VCO circuits for all HF band coverage within 500 kHz steps. The sub loop PLL employs the DDS (Direct Digital Synthesizer) system which ensures a rapid lockup time and high quality frequency oscillation for 500 kHz coverage within 10 Hz steps.

### FREQUENCY CONSTRUCTION

### 4-3-2 1ST LO CIRCUIT (PLL UNIT)

The 1st LO circuit employs a dual loop PLL system. One of four VCO oscillation signals (main loop) is mixed with the signals from the sub loop PLL at IC6 and the resulting signal enters the PLL custom IC (IC201).

IC201 contains the DDS circuit for the sub loop PLL and a programmable divider/phase detector for the main loop PLL. The entered signal is divided and detected at the programmable divider and phase detector sections in IC201.

In the sub loop PLL, the reference frequency is generated at a digital synthesizer in the DDS section. The sub loop, therefore, does not use a programmable divider and high speed lock-up times can be obtained.

### 4-3-3 MAIN LOOP CIRCUIT (PLL UNIT)

One of four VCO circuits is switched by the VCO switching signal ("VCO1"–"VCO4"). The oscillated signal is buffer-amplified at Q3 and Q25 and then applied to the mixer (IC6 pin 2). The sub loop PLL output signal is also applied to the mixer (IC6 pin 8).

The mixed signal from pin 5 is passed through a low-pass filter (L37–L39, C119–C125) and then amplified at Q26. The signal is then applied to the PLL IC (IC201 pin 80).

The signal is divided by 2 and applied to a programmable divider section. The divided signal is then phase detected at the phase comparator section with the 250 kHz reference frequency. The phase detected signal is output from IC201 (pins 52, 53) and is then converted to a DC voltage (lock voltage) by the active loop filter (IC2b).

Although a reference frequency of 250 kHz is used, the main loop resolution is 500 kHz, since VCO output is divided by 2 before being applied to the programmable divider section.

The lock voltage is applied to the varactor diodes (D2, D4, D6, D8) in the VCO circuits to change the capacitance of these diodes and control the oscillation frequency. The VCO oscillating signal is then buffer-amplified at the buffer amplifiers (Q3, Q1) and applied to the MAIN unit as a 1st LO signal.

### 4-3-4 SUB LOOP CIRCUIT (PLL UNIT AND DDS BOARD)

IC7 contains an oscillator and mixer circuits. IC7 outputs 0.5115–1.01149 MHz since the oscillated signal is mixed with 60.00 MHz of frequency.

The signal passes through the low-pass filter (L49, C149) and is amplified at Q32. The signal is then phase detected at IC3. The reference frequency of IC3 uses a DDS output from IC201 (pins 6–11, 14–19).

The detected signals are applied to the loop filter (R179, R180, C138) to be converted to a DC voltage (lock voltage). The lock voltage is applied to the varactor diode (D9) to change the capacitance of this diode and control the sub loop VCO oscillation frequency.

### 4-3-5 REFERENCE OSCILLATOR AND 2ND LO CIRCUITS (PLL UNIT)

The reference oscillator circuit consists of Q23 and X1. A 30.00 MHz reference frequency is oscillated to produce a 2nd LO signal, main loop reference frequency and clock signal for DDS.

The reference frequency is buffer-amplified at Q21 and is then divided by 4 at a divider inside IC201. The 7.50 MHz frequency is divided by 30 at IC4 and IC5 to obtain the 250 kHz PLL reference frequency.

The 30.00 MHz reference frequency is multiplied by 2 at Q22 to obtain the 2nd LO signal. The resulting 60.00 MHz signal is filtered at the bandpass filter and is then applied to a sub loop mixer (IC7) and to the MAIN unit via P4 as the 2nd LO signal.

## 4-4 LOGIC CIRCUITS

### 4-4-1 BAND SELECTION DATA (PLL UNIT)

To select the correct bandpass filter, low-pass filter and VCOs on the MAIN and PLL units, the CPU outputs the following band selection data from the I/O expander (IC320, IC323) depending on the displayed frequency.

#### BAND SELECTION DATA

FREQUENCY (MHz)	IC320			IC323
	BPF	BAND VOLTAGE	LPF	VCO
0.5–1.59999	B0	7.4 V	L1	VCO1
1.6–1.99999	B1		L2	
2.0–3.99999	B2	6.1 V	L3	
4.0–7.99999	B3	5.1 V	L4	VCO2
8.0–10.99999	B4	0.0 V		
11.0–14.99999	B5	4.1 V	L5	VCO3
15.0–21.99999	B6	3.2 V		
22.0–29.99500	B7	2.2 V	L6	VCO4

### 4-4-2 RIT CONTROL (PLL UNIT)

The [RIT] control shifts a voltage to shift the receive frequency. The voltage is applied to IC308 (pin 4). IC308 is an A/D converter which outputs 8-bit serial data corresponding to analog input voltage. The resulting serial data is applied to the I/O interface (IC306) port PB00.

### 4-4-3 KEY MATRIX (SW, M-CH AND PLL UNITS)

	KS0 (PC00)	KS1 (PC01)	KS2 (PC02)	KS3 (PC03)	KS4 (PC04)	KS5 (PC05)
KR0 (PA10)	[TUNER]	[SSB]	[XFC]	[FREQ- INP]	[VFO/ MEMO]	[M▶VFO]
KR1 (PA11)	[PRE AMP]	[CW/N]	[TS]	[SPLIT]	[MW]	[CLEAR]
KR2 (PA12)	[ATT]	[AM]	[A/B]	[A=B]	[SEL]	[SCAN]
KR3 (PA13)	[ANT]	[FM/TONE]	[1.8 [1]]	[3.5 [2]]	[7 [3]]	[M-CH UP]
KR4 (PA14)	[TUNE]	[MP-W]	[10 [4]]	[14 [5]]	[18 [6]]	[M-CH DN]
KR5 (PA15)	[AGC]	[MP-R]	[21 [7]]	[24.5 [8]]	[28 [9]]	[RIT]
KR6 (PA16)	[NB]	[MIC U/D]	[GENE [□]]	[29 [0]]	[ENT]	[▶TX]
KR7 (PA17)	[COMP]	[MIC CK]	[LOCK]	[DOWN]	[UP]	[NOTCH]

### 4-4-4 CPU (PLL UNIT)

The CPU (IC303) contains an 8-bit CMOS CPU with a 12.288 MHz clock for rapid operation. The CPU controls the operating frequency, mode, function display, etc. The memory contents such as memory channel information are stored in the RAM IC chip (IC305) using a lithium backup battery which has a normal life of more than 5 years.

The Icom CI-V network system allows the IC-737A to be remotely controlled by a personal computer using an RS-232C I/O port.

### 4-4-5 I/O INTERFACE PORT ALLOCATIONS (PLL UNIT: IC306)

#### • INPUT PORTS

PORT NAME	PIN NUMBER	DESCRIPTION
KR0–KR7 (PA10– PA17)	23–19, 17–15	Input ports for return signals of the key matrix.
DIDN, DIUP (PC16, PC17)	29, 28	Input ports for up/down signal of the main dial.
DITS (PC15)	30	Input port for rapid rotation of the main dial.
DIQ1–DIQ5 (PC10– PC14)	31–35	Input ports for 5-bit data of the main dial.
ADDT (PB00)	47	Input port for serial data of the [RIT] control.
IKEY (PB01)	48	Input port for the internal antenna tuner. This port becomes "LOW" while tuning.
EKEY (PB02)	49	Input port for the external antenna tuner (AH-3). This port becomes "LOW" when the antenna cannot be tuned.
CONNECT (PB03)	50	Input port for connection of the external antenna tuner. This port becomes "HIGH" when an external antenna tuner (AH-3) is connected.
SQLS (PB04)	52	Input port for the squelch signal. This port becomes "LOW" when the squelch is open.
TRC (PB05)	53	Input port for transmit/receive switching signal. This port becomes "HIGH" while transmitting.
CBUS (PB06)	55	Input port for busy signal of the CI-V bus line. This port becomes "HIGH" when the bus line is busy.

## • OUTPUT PORTS

PORT NAME	PIN NUMBER	DESCRIPTION
STEN (PC07)	4	Outputs a strobe enable signal.
KS0-KS6 (PC00- PC06)	5, 7-11, 13	Output strobe signals for the key matrix and output expanders.
$\overline{\text{CRES}}$ (PB11)	37	Outputs a reset signal for the CI-V bus latch.
PODN (PB12)	38	Outputs a control signal for setting the tuning output power of the AH-3.
CSEN (PB13)	39	Outputs a control signal for tuning transmission.
$\overline{\text{ESTART}}$ (PB14)	40	Outputs a control signal for the external antenna tuner (AH-3).
$\overline{\text{ISTART}}$ (PB15)	42	Outputs a control signal for turning the internal antenna tuner ON.
$\overline{\text{ADCS}}$ (PB16)	43	Outputs an enable signal for the output expanders.
ADCK (PB17)	44	Outputs a clock signal for the output expanders.
28M (PA06)	72	Outputs a 28 MHz band signal for the ALC circuit.
DSTB (PA04)	74	Outputs a strobe signal for PLL (IC201).
PSTB (PA03)	75	Outputs a strobe signal for the VCO selector (IC323).
$\overline{\text{INH}}$ (PA02)	76	Outputs an inhibit signal for the LCD drivers and output expanders.
LCE1, LCE2 (PA00, PA01)	78, 77	Output enable signals for the LCD drivers.

## 4-5 ANTENNA TUNER CIRCUITS

### 4-5-1 MATCHING CIRCUIT (TUNE UNIT)

The matching circuit is a T-network. Using 2 motors, the matching circuit obtains rapid overall tuning speed.

Using relays (RL1-RL6), the BPF selector signal (B2-B7) from the PLL unit grounds one of the taps of L1-L4. After selecting the coils, 2 motors (TUNER unit MF1, MF2) adjust C1 and C2 using the output of a motor control circuit to obtain a low SWR (Standing Wave Ratio).

### 4-5-2 DETECTOR CIRCUIT (CTRL UNIT)

The antenna tuner has 3 detector circuits: an SWR detector, a resistance component detector and a reactance component detector.

Forward and reflected power are picked up by L1, detected by D1 and D2, and then amplified at IC1a/b. The amplified voltages are applied to the SWR board. The SWR board outputs a signal according to the ratio of forward power to reflected power. The signal is compared with the reference voltage at IC6a to detect SWR exceeding 3:1.

Resistance components are picked up by L12 and detected by D8 and D9. D8 outputs negative voltage and D9 outputs positive voltage. Output voltage of the resistance component detector is added to the voltage output from D8 and D9. When antenna impedance is higher than 50  $\Omega$ , output voltage is negative; when lower than 50  $\Omega$ , positive.

Reactance components are picked up by comparing the phases of the RF current and RF voltage. The RF current is detected by L10 and R36. RF voltage is detected by C17-C19. Both detector voltages are buffer-amplified at Q1, Q2, Q25 and Q26, and are then applied to the phase comparator (IC3, IC5). The output signal of IC5 is detected at D6 and D7. When the RF current phase leads the voltage phase, the detected voltage is negative; when the current lags the voltage, the detected voltage is positive.

### 4-5-3 MOTOR CONTROL CIRCUIT (CTRL UNIT)

The antenna tuner CPU (IC10) controls the tuning motors and memorizes the best preset position on each band. The memory contents are stored in the CPU using a lithium backup battery which has a normal life of more than 5 years.

The output signal of the resistance detector is compared with a reference voltage ( $V_{\text{REF}}$ ) at IC6 (pins 5 and 6), and applied to the A/D converter section (IC10, pin 19). The CPU outputs an RC1 or RC2 signal to the motor driver (IC9) to drive the motor (TUNER unit MF2) in the matching circuit. These signals become a pulse signal just around the preset position for precise and rapid tuning. To detect C2 rotation, voltage from the variable resistor (VR-E unit R1) is applied to the CPU.

The output signal of the reactance detector is compared with the reference voltage ( $V_{\text{REF}}$ ) at IC6 (pins 12 and 13), and applied to the A/D converter section (IC10, pin 18). The CPU outputs a  $\phi$  C1 or  $\phi$  C2 signal to the motor driver (IC9) to drive the motor (TUNER unit MF1) in the matching circuit. To detect C1 rotation, a voltage from the variable resistor (VR-D unit R1) is applied to the CPU.

The reset circuit halts the CPU while the motor is not controlled. When the operating band is changed, the band signal comparator (IC13) outputs a "LOW" signal to a reset control circuit. The reset control circuit turns the CPU ON, setting C1 and C2 on the TUNE unit to their preset positions.

When the antenna tuner cannot tune from a previously memorized preset position, a re-try function is activated. The re-try function tunes C1 and C2 from end to end 3 times.

#### 4-5-4 ANTENNA TUNER CPU PORT ALLOCATIONS

##### • INPUT PORTS

PORT NAME	PIN NUMBER	DESCRIPTION
$\phi$ PV	16	Input port for the detection of C1 position.
RPV	17	Input port for the detection of C2 position.
$\phi$	18	Input port for the reactance detection voltage. This voltage becomes $V_{REF}/2$ when the antenna is matched.
R	19	Input port for the resistance detection voltage. This voltage becomes $V_{REF}/2$ when the antenna is matched.
WR	23	Input port for the WRITE mode signal.
SET	24	Input port for the SET signal.
PWRS	26	Detects the power voltage. When the signal is "LOW," the CPU is backed up.
B1-B3	29-27	These are input ports for the 3-bit band signal from the PLL unit.
SEND	30	Inputs transmit/receive switching signals. This port becomes "LOW" while transmitting.
SWR	31	Detects an SWR signal. When the SWR exceeds 3, this port becomes "HIGH."
TUNR	32	Detects a tuner switch signal. The signal is "HIGH" when the [TUNER] switch is turned ON.
RESET	34	Inputs a reset signal. This port becomes "HIGH" at the beginning of transmission or when the operating band is changed.

##### • OUTPUT PORTS

PORT NAME	PIN NUMBER	DESCRIPTION
WAIT	6	Outputs a control signal for the [TUNE] indicator. This port becomes "HIGH" while tuning or pre-setting. This port becomes "HIGH" and "LOW" alternately when the antenna tuner cannot tune the antenna with the re-try function.
b1-b3	10-8	These are output ports for the current 3-bit band signal of the antenna tuner.
$\phi$ C1, $\phi$ C2	12, 11	Output control signals for MF1.
RC1, RC2	14, 13	Output control signals for MF2.
$V_{REF}$	20	Outputs a reference voltage for the resistance and reactance detectors.
WAKE	25	Outputs a control signal for the reset circuit. This port becomes "HIGH" while the CPU clock is oscillated.
TUN	39	Outputs a tuner switch signal. The signal is "HIGH" when the TUNR port is "HIGH."

#### 4-6 REGULATOR CIRCUITS

Either +8 V, +5 V or -5 V DC is supplied from a corresponding regulator circuit. +8 V, +5 V and -5 V DC are regulated at the following circuits using 13.8 V DC.

##### (1) +5 V REGULATOR (PLL UNIT)

+5 V DC is provided by a three-terminal voltage regulator (IC302).

##### (2) +8 V REGULATOR (MAIN UNIT)

+8 V DC is provided by a three-terminal voltage regulator (IC14).

##### (3) -5 V REGULATOR (PLL UNIT)

IC317 generates a negative pulse-type voltage by converting the DC input to AC voltages (approx. 6.7 kHz) as a multi-vibrator. The voltage is rectified at D318 and D319, regulated by a Zener diode (D320) and C347/C348, and is then applied to the MAIN and CTRL units.

## SECTION 5 ADJUSTMENT PROCEDURES

### 5-1 PREPARATION BEFORE SERVICING

#### ■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC	AC millivoltmeter	Measuring range : 10 mV–10 V
	Current capacity : 30 A or more	DC voltmeter	Input impedance : 50 kΩ/DC or better
RF power meter (terminated type)	Measuring range : 10–200 W	Ammeter	Measurement capability: 1 A and 30 A
	Frequency range : 1.8–30 MHz	Audio generator	Frequency range : 300–3000Hz
	Impedance : 50 Ω	Output level : 1–500 mV	
	SWR : Less than 1.2 : 1		
Frequency counter	Frequency range : 0.1–100 MHz	Attenuator	Power attenuation : 50 or 60 dB
	Frequency accuracy: ± 1 ppm or better	Capacity : 150 W or more	
RF voltmeter	Frequency range : 0.1–100 MHz	Spectrum analyzer	Frequency range : At least 90 MHz
	Measuring range : 0.01–10 V	Spectrum bandwidth: ± 100 kHz or more	
Digital multimeter	Input impedance : 10 MΩ/DC or better	FM deviation meter	Frequency range : At least 30 MHz
Standard signal generator (SSG)	Frequency range : 0.1–100 MHz	Measuring range : 0 to ± 10 kHz	
	Output level : 0.1 μV–32 mV (– 127 to – 17 dBm)	Modulation analyzer	Frequency range : At least 30 MHz
Distortion meter	Frequency range : 1 kHz ± 10%	Measuring range : 0–100%	
	Measuring range : 1–100%	External speaker	Impedance : 8 Ω
Oscilloscope	Frequency range : DC–20 MHz	Max. input power : 5 W	
	Measuring range : 0.01–10 V	Terminator	Resistance : 50 and 150 Ω
		Capacity : 150 W or more	

CW: Clockwise    CCW: Counterclockwise

## SECTION 7 MECHANICAL PARTS

### 7-1 FRONT AND CABINET PARTS

LABEL NUMBER	ORDER NO.	DESCRIPTION	QTY.	LABEL NUMBER	ORDER NO.	DESCRIPTION	QTY.
①	8210009271	1296 front panel (D) -1 complete (incl. ⑳-㉓)	1	④①	6510000190	Connector FM214-8SS (P) [MICROPHONE] (incl. nut)	1
②	8810000990	Screw PH B0 M2 × 5	9	④②	7210001990	Variable resistor RV-233 (RK1242210) 10KB/10KA [SQL/AF] (incl. nut, washer)	1
③	8610008440	Button spacer for K201	1				
④	8930027110	Push spring (P)	1				
⑤	8930027960	1296 push spring	3	④③	7210002270	Variable resistor RV-279 (RK1242210) 250KC/10KB [KEY SPEED/MIC] (incl. nut, washer)	1
⑥	8930027120	1296 knob plate	1				
⑦	8610008420	Button K201 [POWER]	1				
⑧	8610008430	Button K202 [TRANSMIT]	1	④④	2250000110	Encoder SW-147 (EC24B50B) [MAIN DIAL] (incl. nut, washer)	1
⑨	8210009330	1296 front glass (A)	1				
⑩	8610008450	Knob cover for N96	1				
⑪	8610008570	Knob N96 (A) assembly [MAIN DIAL]	1	④⑤	2260001870	Switch SW-146 (SRBMIL) [M-CH] (incl. nut, washer)	1
⑫	8610008410	Button K200 [BK-IN (VOX), FULL]	2				
⑬	8610008500	Knob N69 (A) [AF, MIC]	2				
⑭	8610008510	Knob N45 (D) [SQL, KEY SPEED]	2	④⑥	7210002300	Variable resistor RV-282 (RK0971110) 10KB [PBT] (incl. nut, washer)	1
⑮	8930027460	1296 knob sheet	1				
⑯	8930027470	1296 brake pad	1				
⑰	8930027090	1296 brake plate	1	④⑦	7210002280	Variable resistor RV-281 (RK0971110) 10KB [RIT/ΔTX] (incl. nut, washer)	1
⑱	8810007750	Screw PH B1 M3 × 18 ZK	1				
⑲	8820000770	1296 screw	1				
⑳	8850001330	Insulate flat washer (M)	1	④⑧	7210002290	Variable resistor RV-280 (RK0971110) 100KC [NOTCH] (incl. nut, washer)	1
㉑	8610008470	Knob N113 (C) [M-CH]	1				
㉒	8610008460	Knob N113 (B) [PBT, NOTCH, etc.]	3				
㉓	8810002260	Screw FH B0 M3 × 6	8	④⑨	8930027140	1296 LCD rubber	1
㉔	8610008390	Button K-198 [TUNER, TUNE, etc.]	1	④⑩	5030000910	LCD FTD-11668AAPH [FUNCTION DISPLAY]	1
㉕	8610008370	Button K-196 [SSB, CW/N, etc.]	1				
㉖	8610008380	Button K-197 [XFC, TS, etc.]	1				
㉗	8610008340	Button K-193 [SEL, SCAN, etc.]	2	④⑪	8930027390	1296 A-LCD filter (A)	1
㉘	8930027330	1296 meter sponge	1	④⑫	8930027040	1296 LCD holder	1
㉙	5510000400	Meter ME-32 (MG-113S) [S/Rf METER]	1	④⑬	8930000200	Stand-off (P)	1
				④⑭	8810001350	Screw PH B1 M3 × 6	8
④⑮	8010002990	Meter holder	1	④⑯	8810000010	Screw PH M2 × 4	1
④⑰	8810004010	Screw PH B0 M2 × 8	21	④⑲	8810004320	Screw OH M3 × 8 ZK BS	19
④⑱	8810003160	Setscrew A M3 × 6	2	④⑳	8110004960	1296 top cover (complete)	1
④㉑	6450001230	Snap plate HLJ0999-01-480	1	④㉑	8110004970	1296 bottom cover (complete)	1
④㉒	8930003200	Spacer (P)	1	④㉒	6510000410	Connector MR-DS-E 02 [ANT1, ANT2]	2
④㉓	8950002970	1296 bushings nut	1	④㉓	8930027350	1296 ANT plate	1
