

SERVICE MANUAL

VHF/UHF ALL MODE TRANSCEIVER

IC-820H

INTRODUCTION

This service manual describes the latest information for the IC-820H at the time of publication.

MODEL	VERSION NO.	VERSION	SYMBOL
IC-820H	#12	Europe	EUR
	#14	Australia	AUS
	#15	Sweden	SWE
	#16	U.S.A.	USA

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. Such a connection could cause a fire hazard and/or electric shock.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110000960 S.IC NJM4558M(T1) IC-820H MAIN UNIT 1 piece
8810005510 Screw OH M3 x 6 IC-820H Top cover 6 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB to 50 dB attenuator between the transceiver and a deviation meter or spectrum analyser when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

- Frequency coverage :

Version	144 MHz band	440 MHz band
U.S.A.	Rx: 136.0–174.0 MHz* Tx: 144.0–148.0 MHz	430.0–450.0 MHz
Europe	144.0–146.0 MHz	430.0–440.0 MHz
Australia	144.0–148.0 MHz	430.0–450.0 MHz
Sweden	144.0–146.0 MHz	432.0–438.0 MHz

* Guaranteed range is 144.0–146.0 MHz.

- Mode : SSB (A3J), CW (A1), FM(F3)
- Number of memory : 116 channels (50 regular, 1 call, 2 scan edges for each band and 10 satellite memories)
- Antenna impedance : 50 Ω unbalanced
- Usable temperature : -10°C to +60°C; +14°F to +140°F range
- Frequency stability : ±3 ppm (-10°C to +60°C)
- Power supply requirement : 13.8 V DC ±15%
- Current drain :

Transmit	High	16.0 A
	Low	7.0 A
Receive	Max audio	2.5 A
	Stand-by	2.0 A
- Dimensions : 241(W) x 94(H) x 239(D) mm
9.5(W) x 3.7(H) x 9.4(D) in (projections not included)
- Weight : 5.0 kg; 11.0 lb

■ TRANSMITTER

- Output power :

BAND	MODE	HIGH	LOW
144 MHz	FM, CW	45 W	6 W
	SSB	35 W	6 W
430 MHz	FM, CW	40 W	6 W
	SSB	30 W	6 W

- Spurious emissions : Less than -60 dB
- Carrier suppression : More than 40 dB
- Unwanted sideband : More than 40 dB
- Microphone impedance : 600 Ω

■ RECEIVER

- Receive system

144 MHz band	SSB, CW	Single conversion superheterodyne
	FM	Double conversion superheterodyne
430 MHz band	SSB, CW	Double conversion superheterodyne
	FM	Triple conversion superheterodyne

- Intermediate frequencies: (Unit: MHz)

	MODE	MAIN BAND			SUB BAND		
		1st	2nd	3rd	1st	2nd	3rd
VHF	SSB	10.8500	—	—	10.9500	—	—
	CW	10.8491	—	—	10.9491	—	—
	FM	10.8500	0.455	—	10.9500	0.455	—
UHF	SSB	71.2500	10.8500	—	71.3500	10.9500	—
	CW	71.2491	10.8491	—	71.3491	10.9491	—
	FM	71.2500	10.8500	0.455	71.3500	10.9500	0.455

- Sensitivity (both VHF and UHF bands)

FM	0.18 μV for 12 dB SINAD
SSB, CW	0.11 μV for 10 dB S/N
- Squelch sensitivity (both VHF and UHF bands)

FM	Threshold	Less than 0.1 μV
	Tight	Less than 0.5 μV
SSB, CW	Threshold	Less than 1.0 μV
	Tight	Less than 3.2 mV
- Selectivity :

SSB, CW	More than	2.3 kHz/-6 dB
	Less than	4.2 kHz/-60 dB
CW narrow (optional)	More than	0.5 kHz/-6 dB
	Less than	1.34 kHz/-60 dB
FM	More than	15.0 kHz/-6 dB
	Less than	30.0 kHz/-60 dB
- Spurious and image rejection ratio : More than 60 dB
- Audio output power : More than 2.0 W at 10% distortion with an 8 Ω load
- RIT variable range : SSB, CW ±2 kHz (max.)
FM ±10 kHz (max.)

All stated specifications are subject to change without notice or obligation.

SECTION 2 DISASSEMBLY INSTRUCTIONS

● Opening the top and bottom covers

- ① Remove 8 screws (M3 x 6) from the transceiver's top and 4 screws (M3 x 6) from the sides, then lift up the top cover.
- ② Turn the transceiver upside down.
- ③ Remove 4 screws (M3 x 6) from the bottom cover, then lift up the bottom cover.

Fig. 1

● Opening the inside chassis

- ① Remove the top and bottom covers as shown Fig. 1.
- ② Loosen the gutter screw on each side of the front panel's rear side.
- ③ Remove 1 screw (M3 x 4) from each side of the front panel's rear side.
- ④ Pull the front panel forward as shown by the arrow at right.
- ⑤ Loosen 1 (M3 x 4) flat head screw from each side of the MAIN unit chassis.
- ⑥ Remove the 2 silver screws (Icom screw "A") from the rear panel.
- ⑦ Lift up the MAIN unit chassis to see the PLL unit.
- ⑧ Tighten the screws (labelled ⑤) to fix the MAIN unit chassis in a vertical position.

Fig. 2

● Removing the MAIN unit

- ① Remove the top and bottom covers as shown Fig. 1.
- ② Remove 14 screws (3 x 6) from the MAIN unit as shown below.
- ③ Slide the MAIN unit forward slightly to free the ACC socket from the rear panel.
- ④ Lift up the MAIN unit from the rear panel side.

Fig. 3

● To see the PA-B unit

- ① Open the top and bottom covers as shown Fig. 1.
- ② Remove 8 screws (3 x 6) from the internal shield cover, then lift up the cover.

Fig. 4

SECTION 3 INSIDE VIEWS

• MAIN UNIT

- *1 : Located underside of this point.
- *2 : Optional unit

• **RF-A, RF-B AND PA-B UNITS**

*1 : Located underside of this point.

• **PA-A AND PLL UNITS** (The both unit appear when the MAIN unit is removed.)

*1 : Located underside of this point.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

Note: [main] = Main band [sub] = Sub band

4-1-1 VHF RF SWITCHING CIRCUIT (PA-A AND RF-A UNITS)

The RF switching circuit leads receive signals to bandpass filters from an antenna connector while receiving. While transmitting, this circuit leads the signals from the RF power amplifier to the antenna connector. This circuit includes a 20 dB RF attenuator circuit to prevent distortion from very strong signals.

RF signals from an antenna connector, pass through the low-pass filter (L3–L5, C5–C9), and are then applied to the antenna switching circuit (L6, C10, D2, L7, C11, D3, C12) on the PA-A unit.

The signals from the PA-A unit are applied at the 20 dB attenuator (D15) on the RF-A unit. The attenuator prevents distortion caused by strong signals. The signals are then applied to the RF amplifier circuit (Q7).

4-1-2 VHF RF CIRCUIT (RF-A UNIT)

The amplified signals at Q7 are passed through the bandpass filter (L13–L15, D10–D12, C47, C49–C55, C109, C123) to suppress any undesired band signals.

D10–D13 employ varactor diodes that track the bandpass filters and are controlled by the PLL lock voltage. These diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

4-1-3 VHF 1st MIXER CIRCUIT (RF-A UNIT)

The 1st mixer circuit mixes the receive signals with the 1st LO signal to convert the receive signal frequencies to a 10.85 MHz 1st IF for the main band (a 10.95 MHz 1st IF for the sub band).

The signals from the RF circuit are mixed at Q11 and Q12 with a 1st LO signal (A1LO: 125.15 MHz–163.15 MHz). The 1st LO signal from the PLL unit is amplified at IC2 and is passed through the low-pass filter (L19, L20, C83–C85) to suppress harmonic components. The signal is applied both to the TX (Q1, Q2) and RX (Q11, Q12) mixer circuits.

After passing through the matching circuit (L21), the 1st IF signal is applied to the main band or the sub band IF circuit via the M/S switching circuit (D8, D9, Q5, Q6).

4-1-4 UHF RF SWITCHING CIRCUIT (PA-B AND RF-B UNITS)

Received UHF signals enter the antenna connector and pass through a low-pass filter (L3–L5, C5–C10). When receiving, the antenna switching circuit (D1–D3) turns OFF. The signals pass through a low-pass filter (L6, C12, C60, L7, C14). The filtered signals are applied to the RF-B unit via J4.

The signals from the PA-B unit are either bypassed or passed through the 15 dB attenuator (D16). The attenuator prevents distortion caused by strong signals. The signals are applied to a bandpass filter.

4-1-5 UHF RF CIRCUIT (RF-B UNIT)

A bandpass filter passes only the desired band signals and suppresses any undesired signals.

The filtered RF signals are applied to the RF amplifier (Q16) and are then amplified.

D11–D14 employ varactor diodes that track the bandpass filters and are controlled by the PLL lock voltage. These diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

4-1-6 UHF 1st MIXER CIRCUIT (RF-B UNIT)

The filtered RF signals from Q16 are mixed at L30, Q14, Q15 and L29 with a 1st LO signal (B1LO: 348.75 MHz–388.75 MHz) and are then converted to a 71.25 MHz 1st IF for the main band (71.35 MHz for the sub band).

After passing through the matching circuit (L29), the 1st IF signal is passed through each of a crystal filter (F11 [main]/F12 [sub]) in order to pass only the desired signals (main band: 71.25 MHz/sub band: 71.35 MHz).

The filtered 1st IF signal is applied to the 2nd mixer circuit Q11 passing through D9.

4-1-7 UHF 2nd MIXER CIRCUIT (RF-B UNIT)

The 2nd mixer circuit (Q11) mixes the 1st IF signals and 2nd LO signal (B2LO: 60.4 MHz) to convert the 1st IF to a 2nd IF.

The 1st IF signals from F11 [main]/F12 [sub] are converted to 10.85 MHz [main]/10.95 MHz [sub] 2nd IF signals at the 2nd mixer (Q11).

The 2nd IF signals are applied to the MAIN unit passing through D5 and D1 when the main band is selected, or D5 and D4 when the sub band is selected.

4-1-8 10 MHz IF CIRCUIT (MAIN UNIT)

The IF and AF circuits on the MAIN unit are commonly used for the UHF and VHF bands.

The 10 MHz IF circuit filters and amplifies the 10 MHz IF signals. The 10 MHz IF signals from the VHF 1st or UHF 2nd mixer circuit are applied to MCF (Monolithic Crystal Filter; F12 [main]/F16 [sub]) to suppress out-of-band signals.

The filtered signals are amplified at the IF amplifiers Q13 [main]/Q98 [sub]. These amplifiers have 20 dB gain.

When the SSB or CW mode is selected, the amplified signals are passed through 10 MHz IF filters (F11 [main]/F15 [sub]) or the optional CW narrow filter (main band only). The passed signals are amplified at IF amplifiers (Q60–Q62 [main]/Q77, Q100, Q101 [sub]) and then applied to the demodulator circuit (IC14 [main]/IC22 [sub]).

When the FM mode is selected the amplified signals from Q13 [main] or Q98 [sub] are applied to the FM IF ICs (IC11 [main]/IC13 [sub]). The entered signal is converted to a 455 kHz IF signal and detected to AF signals.

4-1-9 NOISE BLANKER CIRCUIT

The noise blanker circuit detects pulse-type noise, then stops the IF amplifier operation. This circuit is designed for the main band only.

A portion of the signals from FI2 are amplified at the noise blanker amplifiers (Q7, IC6, Q9) and are detected at D17.

When pulse type noise appears and the [NB] switch is turned ON, the noise blanker switch (Q11, Q12) is turned ON, then the source of the IF amplifier (Q13) is open via Q14, to stop the Q13 function.

Q8 and Q10 function as an AGC circuit to reduce averaged noise. Therefore, the noise blanker function shuts off pulse-type noise only.

• **Noise blanker circuit**

4-1-10 DEMODULATOR CIRCUIT (MAIN UNIT)

(1) **FM mode**

The 10 MHz IF signals are converted into 455 kHz IF signals in the FM IF IC (IC11 [main]/IC20 [sub]). The 455 kHz IF signals pass through the IF filter (FI13 [main]/FI14 [sub]) and are then converted into AF signals. The AF signals output from pin 9 are passed through or bypassed the high-pass filter (IC12a [main]/IC19a [sub]) and are then applied to the AF input mode selector switch (IC16c [main]/IC28b [sub]).

• **AF circuit**

(2) **SSB/CW modes**

The 10 MHz IF signals from Q62 [main] or Q100 [sub] are demodulated into AF signals at the balanced mixer (IC14 [main]/IC22 [sub]). BFO signals are used for demodulation which are produced in the PLL unit for the main band and the crystal oscillator (Q79, X6) for the sub band.

BFO frequencies

MODE	for MAIN band	for SUB band
USB	10.8485 MHz	10.9485 MHz
LSB	10.8515 MHz	10.9515 MHz
CW	10.8483 MHz	10.9483 MHz

4-1-11 AF INPUT MODE SELECTOR SWITCH (MAIN UNIT)

The AF signals from the demodulator circuit are applied to the AF input mode selector switch (IC16 [main], IC28 [sub]). IC16 (IC28) consists of 4 analog switches which are selected with a mode signal and the squelch control signal. The AF signal is output from IC16 (pins 2, 3, 9) for the main band and IC28 (pins 2, 8, 10) for the sub band; then applied to the AF circuit.

4-1-12 AF CIRCUIT (MAIN UNIT)

AF signals from the AF input mode selector switch (IC16 [main], IC28 [sub]) are amplified at the pre-amplifier (IC30 [main], IC31 [sub]). These main and sub bands audio are power-amplified at the stereo amplifier IC (IC32).

The amplified audio signals pass through the JACK unit, [MSP] jack, and are then applied to the speaker.

The sub band audio signals are fed back to the main band channel of the stereo amplifier IC (IC32) via an attenuator to mix both the main and sub bands audio.

4-1-13 AGC CIRCUIT (MAIN UNIT)

The AGC (Automatic Gain Control) circuit reduces IF amplifier gain to keep the audio output at a constant level.

The 2nd IF signal from the IF amplifier (Q62 [main]/Q101 [sub]) is detected at the AGC detector (D44 [main]/D73 [sub]) and is then applied to the DC amplifier (Q65 [main]/Q104 [sub]).

When receiving strong signals, the detected voltage increases and the AGC voltage decreases via the DC amplifier (Q65 [main]/Q104 [sub]). As the AGC voltage is used for the bias voltage of the IF amplifiers (Q13, Q61, Q62 [main]/Q98, Q100, Q101 [sub]), the IF amplifier gain is decreased.

4-1-14 S-METER CIRCUIT (MAIN UNIT)

The S-meter circuit indicates the relative received signal strength while receiving by utilizing the AGC voltage which is changed depending on the received signal strength.

The AGC bias voltage is applied to a differential amplifier (IC15 pin 6 [main]/IC23 pin 2 [sub]) where the difference between AGC and reference voltages is detected.

The resulting S-meter signal is applied to the DISPLAY unit via the "MSM" line [main] or "SSM" line [SUB]. The full scale position is set by R253 [main]/R207 [sub].

The S-meter signal is also applied to the squelch circuit (IC15a pin 2).

4-1-15 SQUELCH CIRCUIT (MAIN UNIT)

(1) FM mode

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switches.

Some noise components in the AF signal from IC11 pin 9 [main]/IC20 pin 9 [sub] are applied to an active filter section (IC4 pin 10 [main]/IC20 pin 10 [sub]) via the noise control circuit (IC13 pins 7, 9 [main]/IC21 pins 7, 9 [sub]).

The squelch level setting volume control (R1) on the VR unit adjusts the noise control circuit (IC13 · IC21/pin 7) input level.

(2) SSB/CW modes

The squelch circuit mutes audio output when the S-meter signal is lower than the [SQL] control setting level.

The S-meter signal from (IC15b pin 7 [main]/IC23a pin 1 [sub]) is applied to the comparator (IC15a pin 2 [main]/IC23b pin 6 [sub]) through D42 [main]/D71 [sub] to be compared with the threshold level set by the [SQL] control.

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT (DISPLAY UNIT AND MAIN UNIT)

The microphone amplifier circuit amplifies the microphone input signals and outputs the amplified signal to the FM modulation circuit or SSB modulation circuit.

The microphone amplifier circuit is commonly used for both FM (VHF/UHF) mode and SSB (VHF/UHF) mode.

Audio signals from the [MICROPHONE] connector are amplified at IC3. The amplified signals are then adjusted at the [MIC] control (R31) and amplified again at IC2a (MAIN unit).

(1) While in FM mode

The amplified signals from IC2a are applied to IC1b (pin 6) and pass through the microphone gain adjustment (R41). IC1b includes a low level amplifier with pre-emphasis and a limiter amplifier.

The output signals from IC1b (pin 7) pass through a splatter filter circuit (IC1a) and are adjusted for deviation at R29.

A subaudible tone encoder signal is amplified at the high-impedance input circuit (Q4) and is directly applied to the modulation circuit (X1, Q17, D22) without audio modulation interference.

(2) While in SSB mode

The amplified signals at IC2a are applied to the balanced modulator (IC7).

The balanced modulator converts the AF signal from the microphone amplifier to an IF signal with a BFO (Beat Frequency Oscillator) signal. The IF signal is shown in the table below.

MODE	Transmit IF signal
USB	10.8485 MHz
LSB	10.8515 MHz
CW	10.8491 MHz

IC7 is a double balanced mixer IC and outputs a double side band (DSB) signal with -60 dB carrier suppression. R156 and R158 adjust the balanced level of IC7 for maximum carrier suppression.

4-2-2 CW KEYING CIRCUIT

When keying is closed, the CW keying circuit (Q84) outputs "HIGH." This "HIGH" signal is converted to "LOW" at Q20-Q22 and is then applied to the PLL unit for BFO circuit control.

DC voltages (CW 9 V) upset the balance of the modulator IC (IC7). Therefore, the carrier signal is created when the BFO signal is applied to the modulator.

When the CW break-in function is activated, the emitter of Q83 is grounded, the keying signal from Q84 turns Q83 ON to inform the SEND control signal to the CPU.

Q80 is a CW side tone oscillator for generating an 800 Hz tone frequency. When CW key is closed, C307 is disconnected from the collector of Q80, so that Q80 activates.

4-2-3 TRANSMIT IF AMPLIFIER (MAIN UNIT)

In SSB or CW mode, the transmitter IF signals (USB: 10.8485 MHz, LSB: 10.8515 MHz, CW: 10.8491 MHz) pass through F11 to suppress the unwanted sideband signals, then the signals are applied to the transmit IF amplifier (Q1).

In FM mode, the transmit IF signals bypass F11 and are then applied to the transmit IF amplifier (Q1).

The optional CW narrow filter is not used in transmitting.

(1) When selecting the VHF band (RF-A UNIT)

The amplified signal from Q1 (MAIN unit) is applied to the RF-A unit via J1 and then mixed with the 1st LO signal (125.15 MHz–163.15 MHz) to be converted to the displayed frequency at the balanced mixer (Q1, Q2). The sub band is not transmitted.

(2) When selecting the UHF band (RF-B UNIT)

The amplified signal from Q1 (MAIN unit) is applied to the RF-B unit via J2 and then mixed with the 2st LO signal (60.4 MHz) to be converted to a 2nd transmit IF signal at Q1/Q2.

MODE	2nd Transmit IF signals
USB	71.2485 MHz
LSB	71.2515 MHz
CW	71.2491 MHz

The 2nd transmit IF signal is amplified at Q3 and is then converted to the displayed frequency at the double balanced mixer (IC3) with the 1st LO signal (348.75 MHz–388.75 MHz).

4-2-4 RF CIRCUIT (RF-A AND RF-B UNITS)

The RF circuit amplifies the displayed frequency signal for 45 W* of RF output power.

* 30 – 45W depends on band and mode.

(1) RF circuit for the VHF band (RF-A unit)

The displayed frequency signal converted at the balanced mixer (RF-A unit Q1, Q2) is applied to the bandpass filter (L3, C120, D3, C13–C15, L4, D4, C121, C16–C18, L5, D5, C19, C122) where unwanted frequencies are reduced in the VHF bands.

The filtered signal is then amplified at IC1 and Q4. The amplified signal is amplified to 800 mW at Q13 through the LO trap circuit (C36, L10, L11, C37) and is then applied to the PA-A unit.

(2) Power amplifier circuit for the VHF band (PA-A unit)

The signal from Q13 is amplified at the power amplifier (IC2) to obtain a stable 45 W of RF output power and then applied to the 144 MHz antenna connector via the low-pass filter.

(3) RF circuit for the UHF band (RF-B unit)

The displayed frequency signal converted at the double balanced mixer (RF-B unit IC3) is amplified at IC1 through the spurious filter (L36) where unwanted frequencies are reduced in the UHF bands.

The amplified signal is amplified to 200 mW at Q4/Q5 through the spurious filter (L37) and is then applied to the PA-B unit.

(4) Power amplifier circuit for the UHF band (PA-B unit)

The signal from Q5 is amplified to 4 or 5 W at the drive amplifier (IC3) through the low-pass filter circuit (RF-B unit L14, C38, C39) and attenuator (PA-B unit R13–R15).

The signal from IC3 is amplified at the power amplifier (IC1) to obtain a stable 40 W of RF output power.

4-2-5 ALC CIRCUIT (PA-A, PA-B AND MAIN UNITS)

The ALC (Automatic Level Control) circuit controls the gain of IF amplifiers in order for the transceiver to output a constant RF power set by the [PWR/COMP] switch even when the supplied voltage shifts, etc.

The RF power signal level is detected at D4–D7 (PA-A unit for VHF) or D4, D5 (PA-B unit for UHF) and applied to the MAIN unit as the "FORA" or "FORB" signals.

The "FORA (FORB)" voltage from the PA-A (PA-B) unit is applied to IC3a (pin 2). The "POCO" voltage is applied to IC3a (pin 3) as the reference voltage.

When the "FORA (FORB)" voltage exceeds the "POCO" voltage, ALC bias voltage from IC3a (pin 1) controls the IF amplifier (Q1). This adjusts the output power to the determined level by the [PWR/COMP] switch until the "FORA (FORB)" and "POCO" voltages are equalized.

The "FORA (FORB)" voltage is also applied to IC5a to obtain an RF meter signal. It passes through the meter switching circuit (IC4b DISPLAY unit) and is then applied to the S/RF meter.

The ALC voltage for data communication is directly applied to Q1 from the ALC socket (pin 8) through R289.

4-2-6 APC CIRCUIT (PA-A/B UNITS)

The APC (Automatic Power Control) circuit protects the power amplifiers on the PA-A/PA-B units from excessive current.

For the current APC, the power module current is obtained by differential voltages (AIC2: VHF/BIC2: UHF) which appear at both terminals of a 0.15 Ω resistor, R1/R12 (VHF) on the PA-A unit or R1/R16 on the PA-B unit.

The differential voltage is applied to the differential amplifier (IC4b pin 5: VHF/IC4b pin 3: UHF on the MAIN unit).

The amplified APC voltages are applied to the transmit IF amplifier Q1 and the ALC amplifier IC3b on the MAIN unit. They control the output power at the power module.

4-2-7 TEMPERATURE PROTECTION CIRCUIT (DISPLAY AND PA-A/B UNITS)

Cooling fans (MF1) are activated during transmitting or if the temperature of the power modules exceeds the preset value.

While transmitting, Q26 and Q27 on the DISPLAY unit are turned ON, and provide a voltage "FANV" to MF1. The MF1 rotates at medium speed in this case.

A thermal switch (S1) is thermally-connected to the power module IC1 on the PA-B unit. When the power module temperature exceeds 90°C (194°F), S1 turns ON and provides a voltage for high speed rotation to MF1 via Q25 on the DISPLAY unit.

When the power module radiator on the PA-B unit temperature exceeds 40°C (104°F), S1 keeps turning Q24 and Q25 (DISPLAY unit) ON to rotate the cooling fans even when receiving.

4-3 PLL CIRCUITS (PLL UNIT)

The PLL unit contains 3 PLL circuits and 1 local oscillator. The VHF PLL and UHF PLL adopt Icom's new "I-loop PLL" to obtain very fast lock up times.

4-3-1 VHF PLL CIRCUITS

The oscillated signal at the VHF VCO circuit (Q1, D1–D3, D8) is buffer-amplified at Q2 and IC5. The amplified signal is divided by 8 at the prescaler (IC4) and is then applied to the DDS IC (IC1 pin 88).

The DDS IC generates digital signals using the entered signal, then compares it's phase with the reference frequency and outputs off phase components as pulse signals via pins 52, 53.

The output pulses are converted to DC voltages at the loop filter (IC2a) and are then applied to varactor diodes in the VCO circuit (D1–D3, D8).

The D/A converter (R15–R38), low-pass filter (C4–C10, L2–L4) and buffer amplifier (IC14) are connected to the DDS IC to convert the digitally oscillated signals into smooth analog signals.

4-3-2 UHF PLL CIRCUITS

The oscillated signal at the UHF VCO circuit (Q5, D4, D10) is buffer-amplified at Q6 and Q9. The amplified signal is divided by 8 at the prescaler (IC9) and is then applied to the DDS IC (IC6 pin 88).

The DDS IC generates digital signals using the entered signal, then compares it's phase with the reference frequency and outputs off phase components as pulse signals via pins 52, 53.

The output pulses are converted to DC voltages at the loop filter (IC7a) and are then applied to varactor diodes in the VCO circuit (D4, D10).

4-3-3 BFO PLL CIRCUITS

The oscillated signal at the BFO VCO circuit (Q12, D5) is buffer-amplified at Q13 and Q16. The amplified signal is applied to PLL IC (IC12 pin 19) to detect on phase signals using the reference frequency.

• Frequency construction

The oscillated signal at the reference oscillator (X1) is divided by 10 at IC10 and is then applied to IC12 (pin 16) as a reference frequency.

The VCO oscillated signal is divided by 10 at the divider (IC16), buffer-amplified at Q20 and is then applied to the MAIN unit as the BFO frequency.

4-3-4 LOCAL OSCILLATOR CIRCUIT (REFERENCE OSCILLATOR)

The output of the reference oscillator (X1, 30.2 MHz) is used for: (1) the reference frequency of the VHF/UHF PLL circuits, (2) the reference frequency of BFO PLL circuits after being divided by 10, (3) the local frequency for the UHF receiver/transmitter circuits after being multiplied 2 times.

4-4 PORT ALLOCATIONS

4-4-1 CPU (DISPLAY UNIT)

Port name	Pin number	Description
ADCDAT	1	Input port for the FM deviation indicator. When this port receives below 1.3 V or above 1.7 V, the CPU detects the received signal as off center. The "CCTL" port (pin 24) outputs 300 msec. pulses to flash the RX indicator while the squelch is open.
RESET	9	Input port for the CPU reset signal. When receiving "LOW", CPU is reset.
BACKUP	11	Input port for the CPU backup signal. The CPU stores the selected data in RAM while receiving "LOW" pulses.
Mck	12	Outputs clock data to data expander ICs (DISPLAY unit IC11, MAIN unit IC8, IC10, IC24) and optional tone squelch units.
FSTB	13	Outputs a strobe signal to the data expander IC (DISPLAY unit IC11).
Mdat	14	Outputs serial data to data expander ICs (DISPLAY unit IC11, MAIN unit IC8, IC10, IC24) and optional tone squelch units.
OE	15	Outputs an enable signal to data expander ICs (MAIN unit IC8, IC10, IC24) and optional tone squelch units.
CIVR	16	Input port for a "UART" signal for CI-V control.
CIVT	17	Output port for a "UART" signal for CI-V control.
CIVB	18	Input port for a "bus busy" signal for CI-V control.
MCST	19	Outputs a strobe signal to the data expander IC (MAIN unit IC10).
Dick	20	Input port for the dial clock signal.
DIUP	21	Input port for the dial up signal.
DIDN	22	Input port for the dial down signal.
DITS	23	Input port for the auto tuning step signal.
CCTL	24	Outputs the control signal of the main band RX indicator for squelch open and off-center receiving.

Port name	Pin number	Description
BEEP	25	Outputs beep tone signals.
STVO	26	Outputs a strobe signal to an optional voice synthesizer unit.
MSST	32	Outputs a strobe signal to the data expander IC (MAIN unit IC24).
MMST	33	Outputs a strobe signal to the data expander IC (MAIN unit IC8).
KS1-KS7	36-42	Output ports of strobe signals for key matrix.
STBR	43	Outputs a strobe signal to the data expander IC (PLL unit IC13).
KR1-KR4	44-47	Input ports for key return signals.
OPTA	48	Input port for the tone decoder matched signal from an optional tone squelch unit.
OPTB	49	Input port for the tone decoder matched signal from an optional tone squelch unit.
SQSI	51	Input port for the sub band squelch signal. "LOW" : squelch open.
STTA	52	Outputs a strobe signal to an optional tone squelch unit.
STTB	53	Outputs a strobe signal to an optional tone squelch unit.
MT9A	54	Outputs a T9V control signal for the RF-A unit. "HIGH" : while transmitting on the 144 MHz band.
MR9A	55	Outputs a R9V control signal for the RF-A unit. "HIGH" : when 144 MHz band receiving is selected on the main band.
SR9A	56	Outputs a R9V control signal for the RF-A unit. "HIGH" : when 144 MHz band receiving is selected on the sub band.
MT9B	57	Outputs a T9V control signal for the RF-B unit. "HIGH" : while transmitting on the 430 MHz band.
MR9B	58	Outputs a R9V control signal for the RF-B unit. "HIGH" : when 430 MHz band receiving is selected on the main band.
SR9B	59	Outputs a R9V control signal for the RF-B unit. "HIGH" : when 430 MHz band receiving is selected on the sub band.
LCTF	60	Input port for the BFO PLL unlock signal. "LOW" : when the PLL is unlocked.
LCTA	61	Input port for the VHF PLL unlock signal. "LOW" : when the PLL is unlocked.
LCTB	62	Input port for the UHF PLL unlock signal. "LOW" : when the PLL is unlocked.
STBF	63	Outputs a strobe signal to the PLL IC of the BFO PLL (PLL unit IC12).
STBA	64	Outputs a strobe signal to the DDS IC of the VHF PLL (PLL unit IC1).

Port name	Pin number	Description
STBB	65	Outputs a strobe signal to the DDS IC of the UHF PLL (PLL unit IC6).
ck	66	Outputs clock signals to DDS ICs and PLL IC (PLL unit IC1, IC6, IC12).
data	67	Outputs data to DDS ICs and PLL IC (PLL unit IC1, IC6, IC12).
SBTN	90	Outputs a tone signal for the subaudible tone encoder or 1750 Hz tone burst.
SEND	94	Input port for the transmit control signal. "LOW" : while transmitting.
BUSY	95	Input port for an optional voice synthesizer active signal to reduce audio level while talking.
ADTSQ	96	Input port for detecting signals for the optional tone squelch unit installation. 2.18 – 2.72 : when both A/B are installed. 2.72 – 3.31 : when only B is installed. 3.31 – 3.78 : when only A is installed. Other voltages : no unit is installed.
ADU/D	97	Input port for the microphone up/down signal. DN: 0 – 0.8 V; UP: 1.2 – 1.6 V
ADSFT	98	Input port for the position data of the [SHIFT] control.
ADRIT	99	Input port for the position data of the [RIT] control.
ADSSM	100	Input port for the S-meter signal for the sub band meter.

4-4-2 DATA EXPANDER IC (MAIN UNIT)

• IC8

Port name	Pin number	Description
MCWN	4	Outputs CW narrow filter selection signal. "HIGH" : when CW narrow mode is selected.
MCW	5	Outputs CW 8V control signal. "HIGH" : when CW or CW-narrow mode is selected on the main band.
MUSB MLSB	6, 7	Output SSB selection signal for the output power control. "HIGH" : when USB or LSB mode is selected on the main band.
MFM	14	Outputs an FM 8V control signal. "HIGH" : when FM mode is selected on the main band.
/MFM	13	Outputs 8V control signal except FM mode. "HIGH" : when SSB or CW mode is selected on the main band.
TSMF	12	Outputs 8V control signal for FM with tone squelch. "HIGH" : when FM mode with optional tone squelch is selected on the main band.
BKIN	11	Outputs full break-in control signal. "HIGH" : when the full break-in function is turned ON.

• IC10

Port name	Pin number	Description
AFMM	4	Outputs an AF mute signal for the main band. "HIGH" : during mute.
AFMS	5	Outputs an AF mute signal for the sub band. "HIGH" : during mute.
MONM	6	Outputs a squelch open signal for the main band for the monitor function. "HIGH" : while monitor function activates.
MONS	7	Outputs a squelch open signal for the sub band for the monitor function. "HIGH" : while monitor function activates.
SCAM	14	Outputs a scan control signal to control the AGC time constant characteristics. "HIGH" : during scan.
AT8	13	Outputs a T9V control signal for the PA-A unit. "HIGH" : when transmitting on the 144 MHz band.
R8	12	Outputs a R8V control signal. "HIGH" : when receiving.
BT8	11	Outputs a T9V control signal for the PA-B unit. "HIGH" : when transmitting on the 430 MHz band.

• IC24

Port name	Pin number	Description
SUSB	4	Outputs USB control signal for BFO oscillator. "HIGH" : when USB mode is selected on the sub band.
SLSB	5	Outputs LSB control signal for BFO oscillator. "HIGH" : when LSB mode is selected on the sub band.
SFM	6	Outputs an FM 8V control signal. "HIGH" : when FM mode is selected on the sub band.
/SFM	7	Outputs 8V control signal except FM mode. "HIGH" : when SSB or CW mode is selected on the sub band.
MSC	13	Outputs main/sub switching signal for voice synthesizer and beep tone. "HIGH" : when emitting the signal from the main band.

SECTION 5 ADJUSTMENT PROCEDURES

5-1 PREPARATION BEFORE SERVICING

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 25 A or more	Oscilloscope	Frequency range : DC–20 MHz Measuring range : 0.01–10 V
RF power meter (terminated type)	Measuring range : 1–60 W Frequency range : 120–460 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	AC millivoltmeter	Measuring range : 10 mV–10 V
Frequency counter	Frequency range : 0.1–460 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	DC voltmeter	Input impedance : 50 kΩ/V DC or better
RF voltmeter	Frequency range : 0.1–460 MHz Measuring range : 0.01–10 V	Ammeter	Measurement capability : 25 A
Digital multimeter	Input impedance : 10 MΩ/DC or better	Audio generator	Frequency range : 300–3000 Hz Output level : 1–500 mV
Standard signal generator (SSG)	Frequency range : 120–460 MHz Output level : 0.1 μV–32 mV (–127 to –17 dBm)	Attenuator	Power attenuation : 40 or 50 dB Capacity : 60 W or more
Sweep generator	Frequency range : 120–460 MHz Sweep bandwidth : At least 50 MHz Output impedance : 50 Ω	FM deviation meter	Frequency range : 120–460 MHz Measuring range : 0 to ±5 kHz
		External speaker	Impedance : 8 Ω Max. input power : 5 W
