VHF AIR BAND TRANSCEIVER

IC-A22

IC-A22E

IC-A3

IC-A3E

Icom Inc.

INTRODUCTION

This service manual describes the latest service information for the **IC-A22/E** and **IC-A3/E** VHF AIR BAND TRANSCEIVER at the time of publication.

5 versions of the **IC-A22/E** and 5 versions of the **IC-A3/E** have been designed. This service manual covers each version.

MODEL	VERSION NO.	VERSION	SYMBOL
IC-A22	#01	U.S.A.	USA
IC-A22E	#03	Europe	EUR
	#04	Europe	EUR-1
	#05	Australia	AUS
	#06	U.K.	UK
IC-A3	#01	U.S.A.	USA
IC-A3E	#03	Europe	EUR
	#04	Europe	EUR-1
	#05	Australia	AUS
	#06	U.K.	UK

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 15 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

- 10-digit order numbers
- Component part number and name
- Equipment model name and unit name
- Quantity required

〈SAMPLE ORDER〉

1110003680 IC SC1303 IC-A22 RF UNIT 5 pieces
8810008480 Screw PH BT M2X29 ZK IC-A22 Rear Panel 10 pieces

Address are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB to 50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

- Frequency coverage (MHz) :

		IC-A22	IC-A22E	IC-A3	IC-A3E
Tx	Communications	118.000-136.975	118.000-136.975	118.000-136.975	118.000-136.975
	Communications	118.000-136.975	118.000-136.975	118.000-136.975	118.000-136.975
Rx	Navigation	108.000-117.975	108.000-117.975	—	—
	Weather	161.650-163.275	—	161.650-163.275	—

- Mode : Tx/Rx AM (6K00A3E)
Rx FM (16K0G3E; for weather channel) U.S.A. version only
- Number of memory channels : 50
- Channel spacing : 25 kHz
- Frequency stability : $\pm 0.002\%$ (-10°C to $+50^{\circ}\text{C}$; $+14^{\circ}\text{F}$ to $+122^{\circ}\text{F}$)
- Antenna impedance : $50\ \Omega$ (nominal)
- Power supply requirement : 12–15 V DC (negative ground)
- Usable temperature range : -10°C to $+50^{\circ}\text{C}$; $+14^{\circ}\text{F}$ to $+122^{\circ}\text{F}$
- Current drain (at 12 V DC) :

	IC-A22/E	IC-A3/E
Transmit	1.0 A typical	1.0 A typical
Rated audio	400 mA max.	240 mA typical
Squelched	55 mA typical	55 mA typical

- Dimensions : 57 (W) \times 153 (H) \times 35 (D) mm; 2 $\frac{1}{4}$ (W) \times 6 $\frac{1}{32}$ (H) \times 1 $\frac{3}{8}$ (D) in
(Projections not included)
- Weight : 465 g (16.4 oz) with CM-166 and antenna

■ TRANSMITTER

- Output power (at 12 V DC)* : 5.0 W typical (PEP power)
1.5 W typical (Carrier power)
- Modulation system : Low level modulation
- Microphone impedance : $150\ \Omega$
- Spurious emissions* : $-60\ \text{dB}$

■ RECEIVER

- Receive system : Double-conversion superheterodyne
- Intermediate frequency : 1st 35.8 MHz
2nd 455 kHz
- Sensitivity* : Less than $1\ \mu\text{V}$ for 6 dB S/N (with 1 kHz, 30 % modulation)
- Tight squelch sensitivity* : Less than $6.3\ \mu\text{V}$
- Selectivity* : More than 8 kHz/ $-6\ \text{dB}$
Less than 25 kHz/ $-60\ \text{dB}$
- Spurious response rejection* : $-60\ \text{dB}$
- Noise and hum : $-25\ \text{dB}$
- Audio output power* : 600 mW with an $8\ \Omega$ load
- Audio output impedance : $8\ \Omega$

*Specifications guaranteed at a transceiver temperature of $+25^{\circ}\text{C}$ ($+77^{\circ}\text{F}$).
All stated specifications are subject to change without notice or obligation.

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 ANTENNA SWITCHING CIRCUIT (RF UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. The circuit does not allow transmit signals to enter receiver circuits.

Received signals enter the RF unit from the antenna connector (J3001), and then pass through the low-pass filter (L4001–L4003, C4001–C4005) to suppress out-of-band signals. The filtered signals are passed through the $\lambda/4$ type antenna switching circuit (D4001–D4003) with a low-pass filter (L4004, L4005, C4007–C4009), and are then applied to the RF circuit.

3-1-2 RF CIRCUIT (RF UNIT)

The signals from the antenna switching circuit are passed through the bandpass filter (D4006, D4007, L4008, L4009) and amplified at the RF amplifier (Q4001). The amplified signals are again passed through the bandpass filter (D4008, D4009, L4010, L4011), and applied to the 1st mixer circuit.

D4006-D4009 are varactor diodes and are controlled by the PLL lock voltage. The voltage is buffer-amplified at Q4018 and is then applied to the varactor diodes. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection. For weather channel receiving, the tune voltage control circuit (Q4017, Q4019) supplies the bias voltage.

3-1-3 1ST MIXER AND 1ST IF CIRCUITS (RF UNIT)

The signals from the bandpass filter are mixed with a 1st LO signal from the VCO board, and are converted to a 35.8 MHz 1st IF signal. The 1st IF signal is applied to a pair of crystal filters (FI4001) to suppress out-of-band signals, and is then amplified at the 1st IF amplifier (Q4003).

3-1-4 2ND MIXER AND 2ND IF CIRCUITS (MAIN UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double-conversion superheterodyne system improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from the RF unit is applied to a 2nd mixer section of IC5001 (pin 16). The signal is then mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC5001 contains the 2nd mixer, local oscillator, limiter amplifier and quadrature detector. The local oscillator section generates 35.345 MHz using X5001.

The 2nd IF signal from the 2nd mixer (IC5001, pin 3) passes through the ceramic filter (FI5001) to remove unwanted heterodyned frequency. It is then amplified at the 2nd IF amplifier (Q5002).

3-1-5 AM DETECTOR CIRCUIT (MAIN UNIT)

The AM detector circuit demodulates an AM signal on the communication band or navigation band.

The 2nd IF signal from Q5002 is again amplified at IF amplifiers (Q5003, Q5030), and applied to the AM detector (Q5004). It is then detected for conversion to an AF signal.

3-1-6 FM DETECTOR CIRCUIT (MAIN UNIT)

The FM detector circuit demodulates an FM signal for weather channel receiving.

When receiving a weather channel, the 2nd IF signal from Q5002 is applied to the limiter amplifier section (IC5001, pin 5). To demodulate into AF signals, the 2nd IF signal is then applied to the quadrature detector section (IC5001, pins 10, 11) and the discriminator (X5002). The AF signal (detector signal) is output from the IF IC (IC5001, pin 9).

BLOCK DIAGRAM OF RECEIVER CIRCUIT IN THE RF UNIT

3-1-7 SQUELCH CIRCUIT (MAIN UNIT)

The squelch circuit cuts out AF signals when no RF signal is received.

A portion of the 2nd IF signal (from Q5002) is applied to the limiter amplifier section (IC5001, pin 5). Then the IF IC (IC5001) outputs a detected (IF level) signal from pin 12. This signal is applied to the comparator (IC5007), and is then compared with preset squelch voltage. Output from the comparator is applied to the AF selector (IC5002) as an SQL signal, and controls the AF signal line.

3-1-8 AF CIRCUIT (MAIN UNIT)

The AF circuit drives the speaker (SP3001).

AF signals from the detector circuit are selected at the AF selector (IC5002), and are passed through the AF filter (Q5026, Q5005) and volume control (R5082).

The signals are amplified at the AF power amplifier (IC5003) to a level needed to drive the speaker.

3-1-9 AGC CIRCUIT (MAIN UNIT)

The AGC (Automatic Gain Control) circuit reduces signal fading and keeps the audio output level constant.

AF signals from the detector circuit (Q5004) are converted into DC voltage at integral circuits (C5026/R5030, C5026/R5105), and are then applied to inversion amplifiers (Q5010, Q5031).

These amplifiers reduce the amplifier gain of IF amplifiers (Q5002, Q5003, Q4003) and the RF amplifier (Q4001) while receiving a strong signal.

3-1-10 ANL CIRCUIT (MAIN UNIT)

The ANL (Automatic Noise Limiter) circuit (D5003, Q5008, R5015 – R5018) reduces pulse noises.

The AM detector output signal (DETO) from Q5004 is applied to the cathode of D5003 passing through R5015 where it is divided by R5015 and R5016. The DETO signal is also applied to the anode of D5003, passing through R5017 and R5018.

When the ANL function is activated (Q5008 is ON), C5024 is grounded. The detector output, including pulse noise, is applied to the cathode of D5003 only. If pulse noises are received, the cathode voltage of D5003 becomes higher than the anode voltage and D5003 turns OFF. Thus, while pulse noises are received, the detected signal is not applied to IC5002.

ANL CIRCUIT

3-1-11 VOR CIRCUIT (LOGIC UNIT) [IC-A22/E only]

From the AF signal, the VOR circuit detects a variable signal (VORC) and reference signal (VORS) from a VOR station. The VOR circuit sends these signals to the CPU (IC6001).

When the transceiver is set in the navigation band (108.000 – 117.975 MHz), the NAV port (IC6001, pin 43) becomes "HIGH" turning the VOR circuit ON via Q6108. Q6108 controls a 5 V power source for the VOR circuit.

VOR CIRCUIT BLOCK DIAGRAM

The signal from the AM detector (DETO) is buffer amplified at the VOR amplifier (IC6105b).

The DETO signal includes 30 Hz variable phase components and 9960 Hz reference phase components.

The 30 Hz component passes through the 30 Hz bandpass filter (IC6105d), and is converted to a square-wave signal at the VORC comparator (IC6108a). The square-wave signal is then applied to IC6001 (pin 28) as a variable signal (VORC).

The 9960 Hz component passes through the 10 kHz bandpass filter (IC6105c). These components are FM modulated with 480 Hz deviation and 30 Hz modulation.

Signals are then amplified at a limiter amplifier (IC6106a), and detected at an FM detector (IC6106b) to obtain a 30 Hz reference signal.

The 30 Hz signal is compensated on phase at IC6107a. This signal is passed through the 30 Hz bandpass filter (IC6107b) and is converted to a square-wave signal at the VORS comparator (IC6108b). This signal is applied to IC6001 (pin 27) as a reference signal (VORS).

A portion of output from IC6105c is applied to the VOR sensor (Q6109, Q6110). When VOR signal level is low, the output from IC6105c is reduced. Q6110 cannot be turned ON, then IC6001 (pin 29) receives "HIGH" to indicate "OFF FLAG" indicator.

3-2 TRANSMITTER CIRCUITS

3-2-1 MICROPHONE AMPLIFIER CIRCUIT (MAIN UNIT)

AF signals from the microphone or from the [MIC] jack are applied to the ALC amplifier (IC5004, pin 9) through R5047. R5047 adjusts the microphone input level.

The output signal from IC5004 (pin 7) are amplified at the buffer amplifier (IC5005b) and low-pass filter (IC5005a). The signal (MOD) is applied to the AM modulator (D4002) on the RF unit.

When using a headset, the SIDET signal from Q4020 becomes "HIGH," turning IC5008 ON. Then a portion of amplified signal from IC5005b is applied to the AF power amplifier as a monitor signal.

3-2-2 MODULATION CIRCUIT (RF UNIT)

Using the MOD signal from the microphone amplifier circuit, the modulation circuit modulates Tx LO signal from the VCO.

During transmission, the LO signal from the VCO board is output through buffer amplifiers (Q4004, Q4005) and Tx/Rx switch (D4010). This signal is then applied to the AM modulator (D4012).

Q4006 amplifies the LO signal with a gain controlled by an AF signal (MOD) to make low level modulation.

3-2-3 DRIVE/POWER AMPLIFIER CIRCUITS (RF UNIT)

The modulated RF signal from Q4006 is amplified by the pre-drive amplifier (Q4007) and the power amplifier (IC4002) in sequence to obtain 5 W (at 12 V DC) of RF power. The amplified signal is passed through the antenna switching circuit (D4003) and low-pass filter (L4001–L4003, C4001–C4005) and is then applied to the antenna connector (J3001).

3-2-4 APC CIRCUIT (MAIN UNIT)

The APC circuit protects the power amplifier (IC4002) from a mismatched output load.

The APC detector circuit (D4005, L4006, D4004) detects forward signals and rectified signals at D4005 and D4004 respectively. The combined voltage is at a minimum level when the antenna is matched at 50Ω, and is increased when it is mismatched.

The detected voltage is applied to one of the differential amplifier input (Q4010) and a power setting voltage is applied to the other input. When the antenna impedance is mismatched, the detected voltage exceeds the APC output current via Q4014 to decrease the output power.

The current of the APC attenuator (D4013) is controlled by the APC circuit to protect the power amplifier from a mismatched condition as well as stabilize the output power.

APC CIRCUIT

3-3 PLL CIRCUITS

3-3-1 GENERAL (RF UNIT)

A PLL circuit provides stable oscillation of the transmitting frequency and the receiving frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

3-3-2 VCO CIRCUIT (VCO BOARD)

The VCO (Q7001, Q7002, D7001) employs an oscillation circuit. Frequency shifting for transmitting (or weather channel receiving) and receiving is performed by changing the bias voltage of D7002.

LO signals generated by the VCO are amplified at the buffer amplifier (Q7003), and are then applied to the 1st mixer (Q4002) or AM modulator (D4012) through buffer amplifiers (Q4004, Q4005) and Tx/Rx switch (D4010, D4021). Signals from Q7003 are also applied to the PLL IC (IC4001) through a buffer amplifier (Q4015).

3-3-3 PROGRAMMABLE DIVIDER (RF UNIT)

Signals from Q4015 are input into the PLL IC (IC4001, pin 2), and divided N times at the programmable divider section. The divided signals are detected on phase at the phase detector section using the reference frequency. The output signal from the phase detector is passed through the charge pump, and is output from pin 8.

The output signal (error pulse) from pin 8 passes through a loop filter (R4064, R4065, C4102, C4104) and changes DC voltage. This signal is applied to the VCO board as the PLL lock voltage (LV).

The output signal from pin 8 is also applied to the BPF control circuit (Q4018, D4019) to change the center frequency of the receiver bandpass filters.

PLL CIRCUIT BLOCK DIAGRAM

3-4 POWER SUPPLY CIRCUITS

LINE	DESCRIPTION
HV	Voltage line from the attached battery pack or the [DC 12V] jack.
VCC	The same voltage as the HV line which is controlled by [POWER] switch.
5V	Common 5 V converted from the VCC line by the 5V regulator circuit (Q5014, Q5015, D5005) using the reference regulator (IC5006) on the MAIN unit.
+5	Common 5 V converted from the VCC line by the +5 regulator circuit (Q5016, Q5017, D5006) using 5V line as the reference voltage.
R5	5 V for receiver circuit converted from the VCC line by the R5 regulator circuit (Q5019, Q5020, D5007). R5 is controlled by Q5018 using TRC signal from the CPU (IC6001).
T+5	5 V for transmitter circuit controlled by the TMUT signal from the CPU (IC6001). T+5 regulator circuit is located on the RF unit and consists of Q4012, Q4013 and D4016.

3-5 CPU PORT ALLOCATIONS

PIN NO.	PORT NAME	DESCRIPTION
2	LBATT	Input port for detecting the connected battery (or external DC input) voltage for "LOW BATT" or "OVER V" indication
3	SQL	Input port for the squelch condition When squelch open: Low
4	LOK	Input port for the PLL condition When PLL in unlocked: High
14	CLK	Outputs a clock signal to the PLL IC (IC4001).
15	DATA	Outputs N-data to the PLL IC.
16	ENB	Outputs a strobe signal to the PLL IC.
17	SCL	Outputs a clock signal to the EEPROM (IC6002).
18	SDA	Outputs data to the EEPROM.
19	UP	Input port for the tuning dial "UP" clock
20	DOWN	Input port for the tuning dial "DOWN" clock
21	LIGHT	Outputs a backlit control signal for the LCD and keypad. High: for lighting
22	BEEP	Outputs beep signals.
23	CLONE	Outputs clone data.
24	PTT	Input port for the PTT switch When PTT is pushed: High
25	CLONE	Input port for the clone reading
26	BACK UP	Input port for the CPU backup signal
27	VORS *	Input port for the VOR reference signal
28	VORC *	Input port for the VOR variable signal
29	VORO *	Input port for the VOR level signal
30-33	R10-R13	Output ports for the key matrix
34-37	R20-R30	Input port for the key matrix
38-41	R31-R33	Input port for the initial matrix
42	WX	Outputs the WX control signal. High: when a WX channel is selected.
43	NAV *	Outputs the navigation channel signal. High: when a NAV channel is selected.
44	ANL	Outputs the ANL signal. High: to activate the ANL function
46	AFON	Outputs the AF power amplifier control signal. High: to activate the amplifier
47	TRC	Outputs a Tx/Rx control signal. High: for Tx
48	TMUT	Outputs a Tx mute signal. Low: for muting
49	SHIFT	Outputs a "shift" signal for VCO oscillating frequency.
50-93	SEG13-52, COM1-4	Output ports for the LCD drive

Note: Marked * in the PORT NAME column for IC-A22/E only

SECTION 9 BOARD LAYOUTS

9-1 PTT UNIT, VCO BOARD AND PRT UNIT

● PTT UNIT

● VCO BOARD

NOTE: Add "7000" to each indicated part number on the board for the actual part number.

NOTE: Add "7000" to each indicated part number on the unit for the actual part number.

● PRT UNIT

9-2 RF UNIT

The combination of this page and the next page show the until layout in the same configuration as the actual P.C. Board.

NOTE: Add "4000" to each indicated part number on the unit for the actual part number.

NOTE: Add "4000" to each indicated part number on the unit for the actual part number.

NOTE: Add "5000" to each indicated part number on the unit for the actual part number.

9-4 LOGIC UNIT

• LOGIC UNIT FOR IC-A22/E

The combination of this page and the next page show the until layout in the same configuration as the actual P.C. Board.

NOTE: Add "6000" to each indicated part number on the unit for the actual part number.

● LOGIC UNIT FOR IC-A3/E

The combination of this page and the next page show the until layout in the same configuration as the actual P.C. Board.

NOTE: Add "6000" to each indicated part number on the unit for the actual part number.

● LOGIC UNIT FOR IC-A3/E

Parts locations differ depending on models. See above for details.

NOTE: Add "6000" to each indicated part number on the unit for the actual part number.
