

SERVICE MANUAL

SURVIVAL CRAFT 2-WAY RADIO

IC-GM1500
IC-GM1500E

INTRODUCTION

This service manual describes the latest information for the **IC-GM1500** and **IC-GM1500E** SURVIVAL CRAFT 2-WAY RADIO at the time of publication.

MODEL	VERSION NUMBER	VERSION
IC-GM1500	#01, #02	USA
IC-GM1500E	#04, #05	UK
	#06, #07	EUR

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 9 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1140004740 S. IC HD404818C72H IC-GM1500 MAIN UNIT 5 pieces
8810008320 Screw FH M2 x 4 SUS IC-GM1500 Top panel 10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB to 50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

■ GENERAL

- Frequency range : 156.3-156.875 MHz
- Mode : FM (16K0G3E)
- Channel spacing : 25 kHz
- Power supply requirement : 7.5 V DC
- Current drain (at 7.5 V) :

RECEIVE	Power saved	15 mA
	Max. audio	500 mA
TRANSMIT	High	1.5 A
	Low	1.0 A
- Antenna impedance : 50 Ω (nominal)
- Usable temperature range : -20°C to $+60^{\circ}\text{C}$ (-4°F to $+140^{\circ}\text{F}$)
- Frequency stability : $\pm 0.0005\%$ (-20°C to $+60^{\circ}\text{C}$)
- Dimensions : 61 (W) \times 165.5 (H) \times 44 (D) mm; 2.4 (W) \times 6.5 (H) \times 1.7 (D) in
- Weight : 515 g; 1.1 lb oz

■ TRANSMITTER

- Output power (at 7.5 V) : High 2.0 W
Low 0.8 W
- Modulation system : Variable reactance phase modulation
- Maximum frequency deviation : ± 5 kHz
- Spurious emissions : Less than 0.25 μW
- FM noise and hum : More than 40 dB
- Audio frequency response : $+1$ dB to -3 dB of $+6$ dB/octave with 300 Hz to 3000 Hz input

■ RECEIVER

- Receive system : Double conversion superheterodyne
- Sensitivity : 0.35 μV for 20 dB SINAD
- Intermediate frequencies : 1st 30.875 MHz
2nd 455 kHz
- Squelch sensitivity (at threshold) : Less than 0.3 μV
- Adjacent channel selectivity : More than 70 dB
- Intermodulation rejection : More than 68 dB
- Spurious rejection : More than 70 dB
- Spurious emissions : Less than 2 nW
- Audio output power : 500 mW at 10% distortion with 8 Ω load
- FM noise and hum : More than 40 dB
- Audio frequency response : $+1$ dB to -3 dB of $+6$ dB/octave with 300 Hz to 3000 Hz modulation

■ CHANNEL LIST (varies according to version)

Channel number	Frequency (MHz)	Channel number	Frequency (MHz)	Channel number	Frequency (MHz)
06	156.300	13	156.650	67	156.375
08	156.400	14	156.700	68	156.425
09	156.450	15*	156.750	69	156.475
10	156.500	16	156.800	71	156.575
11	156.550	17*	156.850	72	156.625
12	156.600			73	156.675
				74	156.725
				77	156.875

*Low power only

All stated specifications are subject to change without notice or obligation.

• MAIN unit

• LOGIC unit

3-1 RECEIVER CIRCUITS

3-1-1 ANTENNA SWITCHING CIRCUIT (MAIN UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. The circuit does not allow transmit signals to enter receiver circuits.

Received signals enter the antenna connector and then pass through the low-pass filter (L4, L5, C1—C6). The filtered signals are passed through the $\lambda/4$ type antenna switching circuit (D4, L1, L2, C7—C9) and are then applied to the RFA board.

3-1-2 RF AND 1ST MIXER CIRCUITS (RFA/RFB BOARDS AND MAIN UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals from the antenna switching circuit are passed through the tunable bandpass filter (L1, L2, D1, D2) and amplified at the RF amplifier (Q1). The amplified signals are again passed through the tunable bandpass filter (L3, L4, D3, D4) and applied to the MAIN unit. The signals are then mixed at the double balanced mixer (Q12a, Q12b) with a 1st LO signal coming from the PLL circuit to produce a 30.875 MHz 1st IF signal. The 1st IF signal is passed through a pair of crystal filters (F1) and is then applied to the DETA board.

3-1-3 2ND IF AND DEMODULATOR CIRCUITS (DETA BOARD)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signal twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from the MAIN unit is amplified at Q1 and applied to a 2nd mixer section of IC1 (pin 20). The signal is then mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC1 contains the 2nd mixer, local oscillator, limiter amplifier, quadrature detector and active filter. The local oscillator section generates 30.42 MHz using X2.

The 2nd IF signal from the 2nd mixer (IC1, pin 4) passes through a pair of ceramic filter (F1) to remove unwanted heterodyned frequencies. It is then amplified at the limiter amplifier (IC1, pin 6) and applied to the quadrature detector (IC1, pins 9, 10 and X1) to demodulate the 2nd IF signal into AF signals. The AF signals (detector signals) are output from pin 11 and applied to the MAIN unit via the "DETO" line.

FM DETECTOR AND SQUELCH CIRCUITS

3-1-4 AF CIRCUIT (AF BOARD)

AF signals from the DETA board are amplified at the active filters (Q4 HPF; Q5 LPF) and passed through the AF mute switch (Q6) and the [VOL] control (VR unit). The mute switch (Q6) cuts the audio line when the squelch closes.

The passed signals (via "AF2") are amplified at the AF power amplifier (IC1a/b) to a level needed to drive the speaker.

For power conservation, the power supply circuit (Q1, Q2, Q3, D1) does not supply Vcc voltage to the AF power amplifier (IC1) when the squelch closes.

3-1-5 SQUELCH CIRCUIT (DETA and AF BOARDS)

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switch in the AF board.

A portion of the AF signals from the FM IF IC (IC1, pin 11) are applied to the active filter (IC1, pin 13) where noise components above 20 kHz are amplified and output from pin 14. The [SQL] control is connected in parallel to the active filter input (pin 13) to control the input noise level. The output signals are rectified at the noise detector (D1) and then applied to the trigger circuit (pin 15).

The trigger circuit converts the rectified signals to a HIGH or LOW signal and applies this to the CPU (LOGIC unit IC1, pin 27) as the "SQBUSY" signal. When the CPU receives HIGH, the CPU outputs the "RMUT" signal via the I/O expander IC (LOGIC unit IC4, pin 13) to cut the AF signals.

The "RMUT" signal is applied to the AF board and switches the AF mute switch (Q6). At the same time, the "AFON" signal disappears to deactivate the power supply circuit of the AF amplifier (Q1—Q3). However, it activates while emitting beeps.

3-2 TRANSMITTER CIRCUITS

3-2-1 MICROPHONE AMPLIFIER (MIC BOARD)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis characteristics from the microphone to a level needed for the modulation circuit.

The AF signals from the microphone are amplified at the limiter amplifier (MIC board IC1b) which has a negative feedback circuit for +6 dB/octave pre-emphasis.

The signals are amplified at the buffer amplifier (IC2). RF components are then filtered out at the splatter filter (IC1a) and applied to the PLL VCO board as the "MOD" signal.

3-2-2 MODULATION CIRCUIT (PLL VCO BOARD)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The audio signals (MOD) change the reactance of D3 on the PLL VCO board to modulate the oscillated signal at the transmitter VCO (Q7). The oscillated signal is amplified at the buffer amplifier (Q8, Q10), then applied to the drive amplifiers on the MAIN unit.

3-2-3 DRIVE/POWER AMPLIFIER CIRCUITS (MAIN UNIT)

The signal from the PLL VCO board is passed through the transmit/receive switching circuit (D5) and amplified by the pre-driver (Q1), driver (Q3), and the power module (IC3) in sequence to obtain 2 W of RF power. The amplified signal is passed through the APC detector circuit (L8, D2), antenna switching circuit (D1), and low-pass filter (L4, L5, C1—C5) and is then applied to the antenna connector.

The bias current of the pre-drive and drive amplifiers (Q1, Q3) is controlled by the APC circuit to stabilize the output power.

3-2-4 APC CIRCUIT (MAIN UNIT)

The APC circuit provides stable output power even when the input voltage or temperature changes; and selects high or low output power.

The APC detector circuit (L8, D2) detects the output power level. The detected voltage increases according to the output power level.

The detected voltage is applied to one of the differential amplifier inputs (Q15b) and a power setting voltage is applied to the other input (Q15a). When the output power is increased, the detected voltage exceeds the APC output current (Q13 collector) via Q14 to decrease the output power.

APC CIRCUIT

3-3 PLL CIRCUIT (PLL VCO BOARD)

A PLL circuit provides stable oscillation of the transmitter frequency and the receive frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

The IC-GM1500's PLL circuit contains a separate receiver VCO (Q6, D1) and transmitter VCO (Q7, D2). The oscillated signal is amplified at the buffer amplifier (Q8, Q9) and then applied to the PLL IC (IC1, pin 8).

The PLL IC (IC1) contains a prescaler, two programmable dividers, and a phase detector, etc. The entered signal is divided at the prescaler and programmable counter sections by the N-data ratio from the CPU. The divided signals are detected on phase at the phase detector using the reference frequency.

If the oscillated signal drifts, the phase of its frequency changes from the reference frequency, causing a lock voltage change to compensate for the drift in the oscillated frequency.

One of VCO signals is amplified at the buffer amplifiers (Q8, Q10) and is then applied to the receive 1st mixer or transmit driver circuit.

The lock voltage is also used for the receiver tunable bandpass filter to match the filter's center frequency to the desired receive frequency. The lock voltage is amplified at the buffer amplifier (MAIN unit Q5) and then applied to the RFA board.

PLL CIRCUIT BLOCK DIAGRAM

3-4 POWER SUPPLY CIRCUITS

VOLTAGE LINES (MAIN UNIT)

LINE	DESCRIPTION
H.V	The voltage from the attached battery pack.
VCC	The same voltage as the H.V line (battery voltage) which is controlled by the power switch ([OFF/VOL] control).
+5	Common 5 V converted from the VCC line by the 5 V regulator circuit (Q10, Q11) using the reference regulator (IC4).
+5S	Common 5 V controlled by the power saver function. The "+5S" regulator circuit (Q6, Q7 $\frac{1}{2}$) produces 5 V from the VCC voltage using the power save controlled signal from the I/O expander IC (LOGIC unit IC4).
R+5S	5 V for receiver circuit controlled by the power saver function and the T/R switching signal, "SEND" from the I/O expander IC (LOGIC unit IC4). The "R+5S" regulator consists of Q8 and Q7 $\frac{1}{2}$.
T+5	5 V for transmitter circuit controlled by the "TMUTE" signal from the I/O expander (LOGIC unit IC4). The "T+5" regulator circuit consists of Q16 and Q17.

3-5 PORT ALLOCATIONS

3-5-1 EXPANDER IC (LOGIC UNIT IC4)

PIN NO.	PORT NAME	DESCRIPTION
1	STB	Input port for a strobe signal from the CPU.
2	DATA	Input port for a data signal from the CPU.
3	CK	Input port for a clock signal from the CPU.
6	PSC	Outputs a power save control signal to the MAIN unit.
7	CPC	Outputs a charge pump control signal to the PLL VCO board.
11	SEND	Outputs a transmit/receive switching signal. "HIGH" when transmitting.
12	TMUTE	Outputs a transmit mute signal. "LOW" to mute the transmit power.
13	RMUTE	Outputs a receive mute signal. "HIGH" to mute the receive audio.
14	AF ON	Outputs an AF power amp control signal. "HIGH" to activate the AF amp.

3-5-2 CPU (LOGIC UNIT IC1)

PIN NO.	PORT NAME	DESCRIPTION
1	EXSTB	Outputs a strobe signal to the I/O expander IC (IC4).
2	EPEDA	Used for the memory backup EPROM (IC5).
3	EPSC	
5	H/L CONT	Outputs a transmit high/low switching signal. "HIGH" for low power.
6	LAMPO	Outputs a display backlight signal. "HIGH" for backlight ON.
7	H/L KEY	Input port for the [HI/LOW] switch.
8	ENC /B	Input ports for the channel selector.
9	ENC B	
10	ENC A	
15-18	KS0-KS3	Output ports for the initial matrix and key matrix.
19-22	KI0-KI3	Input ports for the initial matrix and key matrix.
23	UNLK	Input port for the unlock signal from the PLL circuit.
27	SQBUSY	Input port for the noise squelch signal from the FM IF IC (DETA board IC1). "HIGH" when the squelch closes.
28	BEEP	Outputs beep tone signals.
29	INT0	Input port for the interrupt signal. "LOW" for CPU stand-by. "HIGH" for CPU operation.
32-56	SEG2-SEG26	Output the LCD drive signal.
63	COM1	Output a common signal for the LCD display.
64	COM2	
74	OSC1	Terminals for CPU clock.
75	OSC2	
76	RESET	Input port for the CPU reset signal.
80	PLSTB	Outputs a strobe signal to the PLL IC (PLL VCO board IC1).

4-1 PLL AND TRANSMITTER ADJUSTMENTS

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
PLL LOCK VOLTAGE	1 • Operating channel: 16 • Receiving	MAIN	Connect the digital multi-meter or oscilloscope to CP1.	2.0 V	PLL VCO	L2
	2 • Transmitting					2.8 V
PLL REFERENCE FREQUENCY	1 • Operating channel: 16 • Transmitting	Top panel	Loosely couple the frequency counter to the antenna connector.	156.800 MHz	PLL VCO	X1
OUTPUT POWER	1 • Operating channel: 16 • [HI/LO] switch: HIGH • Transmitting	Top panel	Connect the RF power meter to the antenna connector.	2.0 W	LOGIC	R29
	2 • [HI/LO] switch: LOW			0.6–1.0 W		Verify
FM DEVIATION	1 • Operating channel: 16 • Apply an AF signal to J1 pins 4 and 5 (LOGIC UNIT): 1 kHz/50 mV • Connect the FM deviation meter to the antenna connector and set as: HPF : OFF LPF : 20 kHz De-emphasis: OFF Detector : (P-P)/2 • [HI/LO] switch : HIGH • Transmitting	Top panel	Connect the FM deviation meter to the antenna connector through the attenuator.	±4.5 kHz	MIC	R19
	2 • Apply and AF signal to J1 pins 4 and 5 (LOGIC UNIT): 1 kHz/5 mV			±3.0 kHz		R20

4-2 RECEIVER ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
SENSITIVITY	1 <ul style="list-style-type: none"> Operating channel: 16 Connect the SSG to the antenna connector and set as: Frequency : 156.80 MHz Level : 3.2 μV^* (-97 dBm) Deviation : ± 3.5 kHz Modulation: 1 kHz Preset cores of coils with the flat surface to the coil (RFB: L1, L2, L3, L4). Receiving 	DETA	Connect the oscilloscope to CP1.	Maximum level	RFB	Adjust in squence L1, L2, L3, L4
					MAIN	L6

* This output level of the standard signal generator (SSG) is indicated as SSG's open circuit.

MAIN UNIT

NOTE 1:
Once the outer case is removed, grease must be applied before assembly.

Manufacture: Shin-Etsu Chemical
Type: G-501

NOTE 2:
Be careful when reattaching ② (1540 seal). This seal must fit snugly between the top panel and transceiver chassis (be sure to observe the correct orientation) to ensure water-tightness. Once the seal is removed, grease must be applied before assembly.

Manufacture: Shin-Etsu Chemical
Type: G-501

NOTE 3:

Once the variable resistors, ⑱ - ⑳ are removed, sealant must be applied before reattachment.

Manufacture: THREE BOND

Type: 1104 liquid gasket

Observe the following points when applying sealant to the variable resistors:

1. Use a soft-tipped painter's brush and apply sealant to the threaded part of the resistors ONLY.
2. Leave the variable resistors in an upright position for 12 hours to let the sealant set.
3. Make sure no sealant is applied to the moving part of the resistors: the sealant will bond here making movement impossible.
4. Read NOTE 4 for reassembly ⑭.

NOTE 4:

Once the VR nuts ⑭ are removed, grease must be applied and O-ring ⑮ must be inserted correctly.

1. Apply grease to the gap at the variable resistor's shank base.

Manufacture: Shin-Etsu Chemical

Type: G-501

2. O-ring ⑮ must be inserted into concentric space of VR-nut ⑭ then gently poke along the entire diameter of ⑮ with a tweezers to ensure it is fully inserted. This procedure should be followed for each of the 3 O-rings to ensure watertightness.
