

SERVICE MANUAL

VHF TRANSCEIVER
IC-H21T

INTRODUCTION

This service manual describes the latest service information for the **IC-H21T** VHF TRANSCEIVER at the time of publication.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1140002220	IC	μPB585G	IC-H21T	TPLL UNIT	5 pieces
8810002310	Screw	FH M2×4 NI	IC-H21T	CHASSIS UNIT	10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 30 dB~40 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

VERSIONS

VERSION NUMBER	REGION	SYMBOL	FREQUENCY RANGE	CHANNEL SPACING	5-TONE IC
#01	General	GEN	146~174 MHz	12.5 kHz	SC-1084
#02	General	GEN-1	146~174 MHz	25 kHz	SC-1084
#03	United Kingdom	UK	146~174 MHz	12.5 kHz	SC-1093
#04	Sweden	SWE	146~174 MHz	25 kHz	SC-1084
#05	Italy	ITA	146~174 MHz	12.5 kHz	SC-1084
#06	Italy	ITA-1	146~174 MHz	25 kHz	SC-1084
#07	Greece	GRE	146~174 MHz	12.5 kHz	SC-1084
#08	France	FRA	146~174 MHz	12.5 kHz	SC-1093
#09	France	FRA-1	146~174 MHz	25 kHz	SC-1093
#10	Holland	HOL	146~174 MHz	20 kHz	SC-1084
#11	General	GEN-2	135~160 MHz	12.5 kHz	SC-1084
#12	General	GEN-3	135~160 MHz	12.5 kHz	SC-1084

To upgrade quality, all electrical and mechanical parts and internal circuits are subject to change without notice or obligation.

SECTION 1 SPECIFICATIONS

■ GENERAL

- Frequency coverage : 135~174 MHz
Ask your Icom Dealer about the permitted frequency range in your area.
- Mode : 16K0F3E (#02, #04, #06, #09)
14K0F3E (#10)
8K50F3E (#01, #03, #05, #07, #08, #11, #12)
- Number of channels : Up to 100 operating channels
Up to 30 5-Tone memory channels
- Channel spacing : 25 kHz (#02, #04, #06, #09)
20 kHz (#10)
12.5 kHz (#01, #03, #05, #07, #08, #11, #12)
- Usable battery pack : CM-72, CM-73 or CM-3G~CM-12G
- Antenna impedance : 50 Ω (unbalanced)
- Usable temperature range : $-25^{\circ}\text{C}\sim+55^{\circ}\text{C}$ ($-13^{\circ}\text{F}\sim+131^{\circ}\text{F}$)
- Frequency stability : ± 1.5 kHz ($-25^{\circ}\text{C}\sim+55^{\circ}\text{C}$)
- Dimensions (with CM-72) : 65 (W) \times 205 (H) \times 35 (D) mm; 2.6 (W) \times 8.1 (H) \times 1.4 (D) in
- Weight (with CM-72) : 660 g (1.5 lbs)

■ TRANSMITTER

- Output power : High: 5 W (with CM-73)
2 W (with CM-72)
Low: 800 mW
- Spurious emissions : 0.25 μW
- Harmonic emissions : 0.25 μW
- FM noise and hum : -40 dB
- Microphone impedance : 600 Ω
- Audio response : $+1$ dB \sim -3 dB of $+6$ dB/octave with 300 Hz to 3000 Hz input

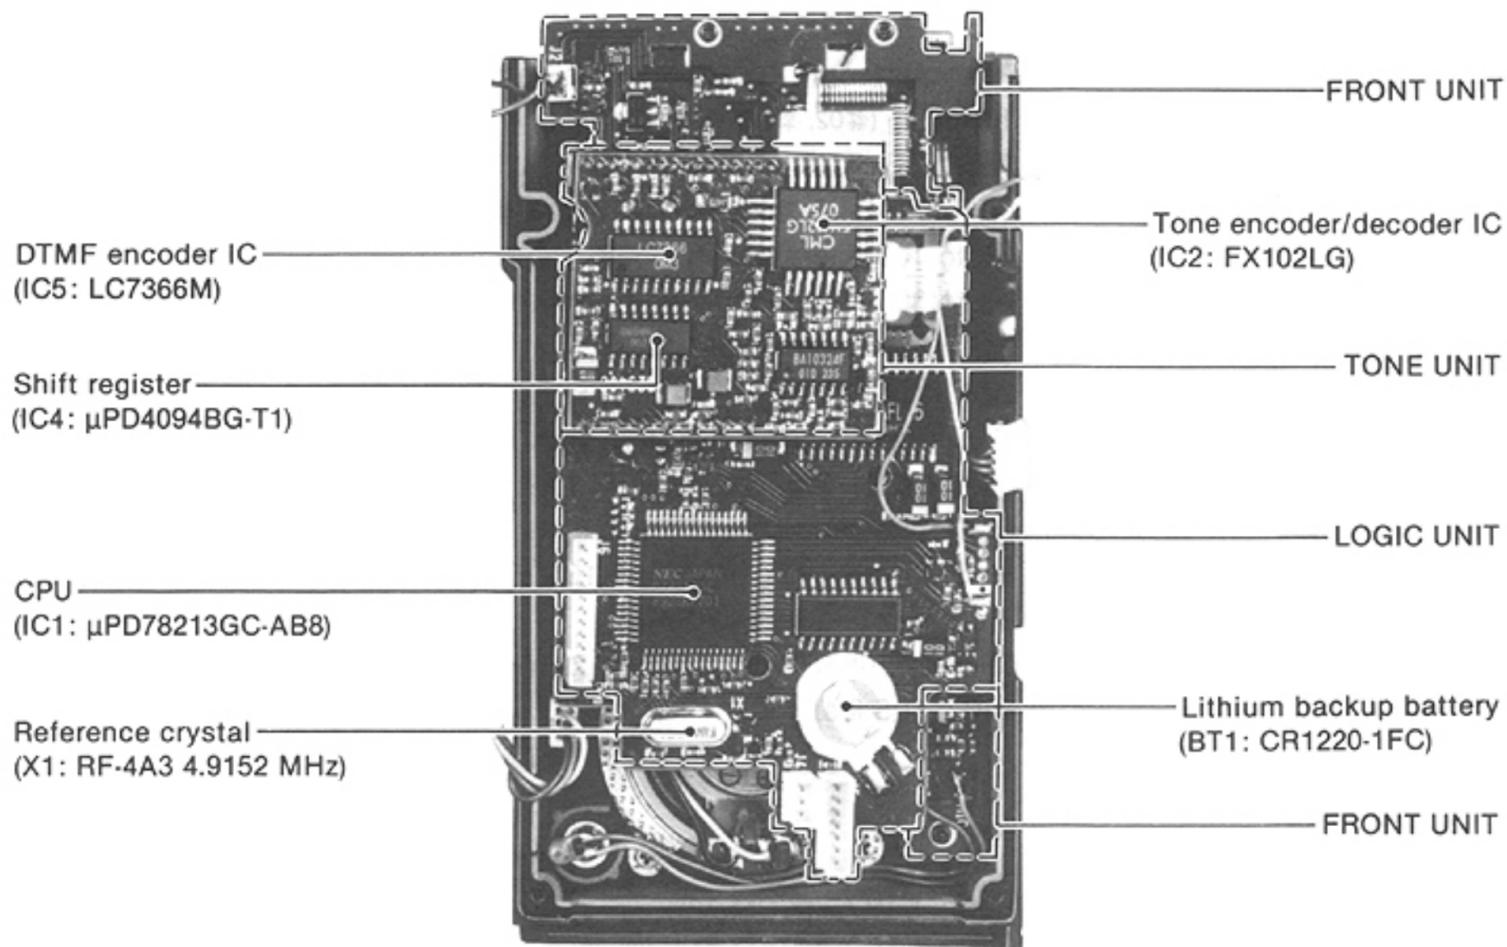

■ RECEIVER

- Sensitivity : 0.35 μV for 12 dB SINAD
- Intermediate frequencies : 1st 30.875 MHz
2nd 455 kHz
- Squelch sensitivity (threshold) : 0.3 μV
- Adjacent channel selectivity : -70 dB (#02, #04, #06, #09)
 -60 dB (#01, #03, #05, #07, #08, #11, #12)
- Intermodulation rejection : -70 dB
- Spurious rejection : -70 dB
- Audio output power : 500 mW with an 8 Ω load
- Audio response : $+1$ dB \sim -3 dB of $+6$ dB/octave with 300 Hz to 3000 Hz input

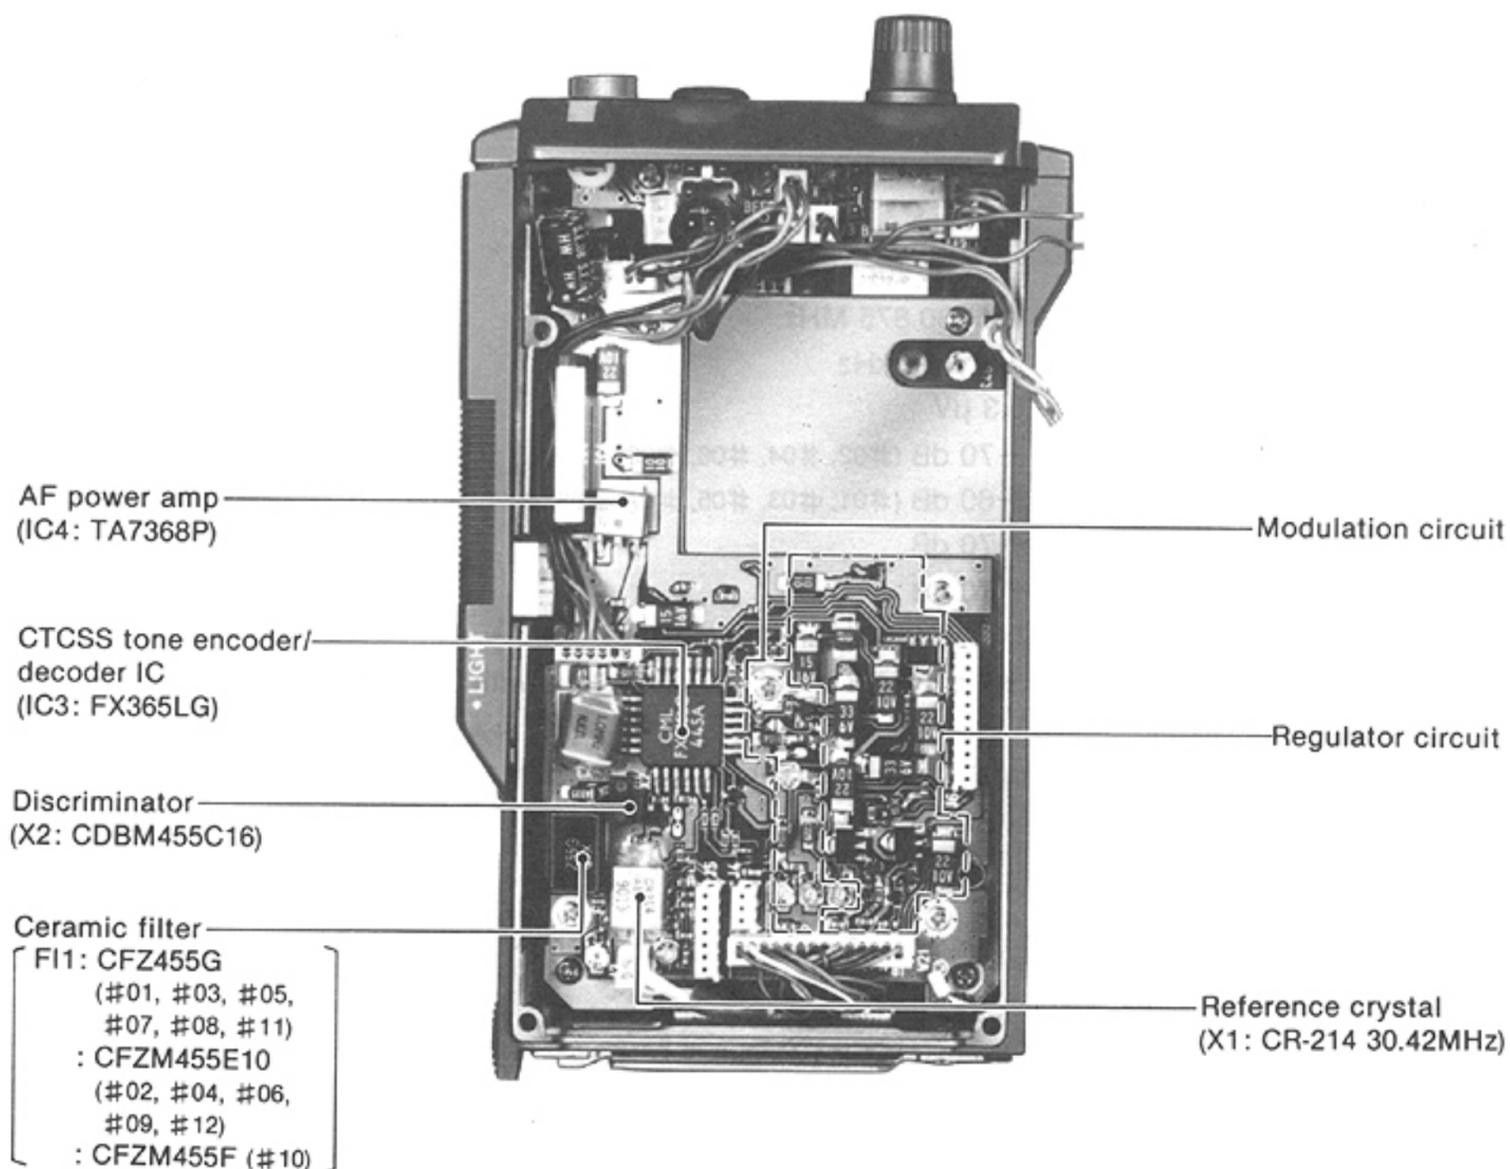

All stated specifications are subject to change without notice or obligation.

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 ANTENNA SWITCHING CIRCUIT (RF UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. The circuit does not allow transmit signals to enter receiver circuits.

Received signals enter the antenna connector and pass through a two-stage Chebyshev low-pass filter (L20, L21, C40~C44) to suppress out-of-band signals. The filtered signals are applied to the $\lambda/4$ type antenna switching circuit (D15, D16, L19, C38, C39) and then to a two-stage bandpass filter (L1, L2, D1, D3, C3, C123, C124).

3-1-2 RF CIRCUIT (RF UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the bandpass filter are applied to the RF amplifier (Q1). The amplified signals enter a two-stage bandpass filter (L3, L4, D6, D7, C7, C125, C126) to suppress unwanted signals.

D1, D3, D6 and D7 employ varactor diodes, that are controlled by the RPLL lock voltage, to track the bandpass filters. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

3-1-3 1st MIXER AND IF CIRCUITS (RF UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The signals from the RF circuit are mixed at Q2 with a 1st LO signal coming from the RVCO circuit to produce a 1st IF signal. The 1st IF signal is applied to L5 and then to a pair of crystal filters (F11) in order to obtain wide selection capability and to pass only the desired signals. The filtered signal passes through a 1st IF amplifier (Q3). The amplified signal is applied to a 2nd IF circuit.

3-1-4 2nd IF AND DEMODULATOR CIRCUITS (MAIN UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from Q3 on the RF UNIT is applied to a 2nd mixer section of IC1 (pin 16) and is then mixed with a 2nd LO signal for conversion to a 455 kHz 2nd IF signal.

IC1 contains the 2nd mixer, local oscillator circuit, limiter amplifier, quadrature detector circuit and active filter circuit. The local oscillator section and X1 generate 30.42 MHz for the 2nd LO signal.

The 2nd IF signal from the 2nd mixer (IC1, pin 3) passes through a high-quality ceramic filter (F11) to suppress unwanted heterodyned frequency signals. It is then amplified at the limiter amplifier section (IC1, pin 5) and applied to the quadrature detector section (IC1, pin 8 and ceramic discriminator X2) to demodulate the 2nd IF signal into an AF signal. The AF signal is output from IC1 (pin 9).

• 2nd IF AND DEMODULATOR CIRCUITS

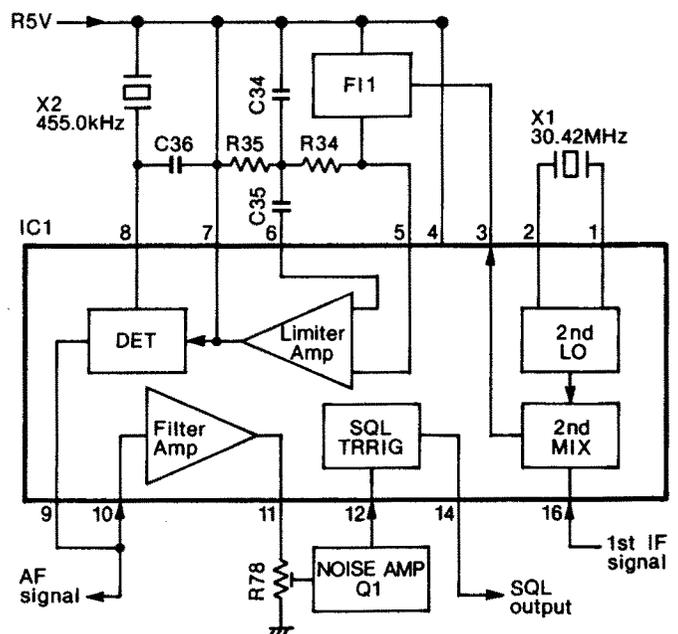

Fig. 1

3-1-5 AF CIRCUIT (MAIN AND VR UNITS)

The AF circuit de-emphasizes the demodulated signal with -6 dB/octave and power-amplifies the AF signal to drive a speaker. The AF circuit includes an AF mute circuit to mute the AF signal with a noise squelch and a tone squelch.

The AF signal output from IC1 (pin 9) is applied to the AF pre-amplifier (IC2a, pin 2). The AF signal obtains -6 dB/octave de-emphasis at R18 and C113, which are connected to pin 2, and is then applied to IC3 (pin 23).

The input signal from IC3 (pin 23) passes through the speech path high-pass filter in IC3 to attenuate a CTCSS tone signal. The filtered signal is output from IC3 (pin 19) and is then applied to the AF preamplifier (IC2b) through an AF mute circuit (Q5). When the squelch is closed, Q5 cuts off the AF signal as an AF mute switch. The amplified signal is applied to the [VOL] control (R2) on the VR UNIT and is then power-amplified at an AF power amplifier (IC4) to drive a speaker.

3-1-6 SQUELCH CIRCUIT (RF, MAIN, VR AND LOGIC UNITS)

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switches.

Some noise components in the AF signal from IC1 (pin 9) are applied to an active filter section (IC1, pin 10). It amplifies the noise components of frequencies 20 kHz and above. The noise signals are output from IC1 (pin 11) and are then applied to the squelch level setting volume control (R78) to adjust the IC1 (pin 10) input level. The signals are amplified at Q1 and are then applied to a squelch trigger circuit section of IC1 (pin 12).

D3 and R9 compensate for temperature and adjust the bias voltage for the squelch trigger circuit. Pin 14 of IC1 outputs a pulse-type signal which contains the hysteresis components. The signal is applied to IC12 (pin 2).

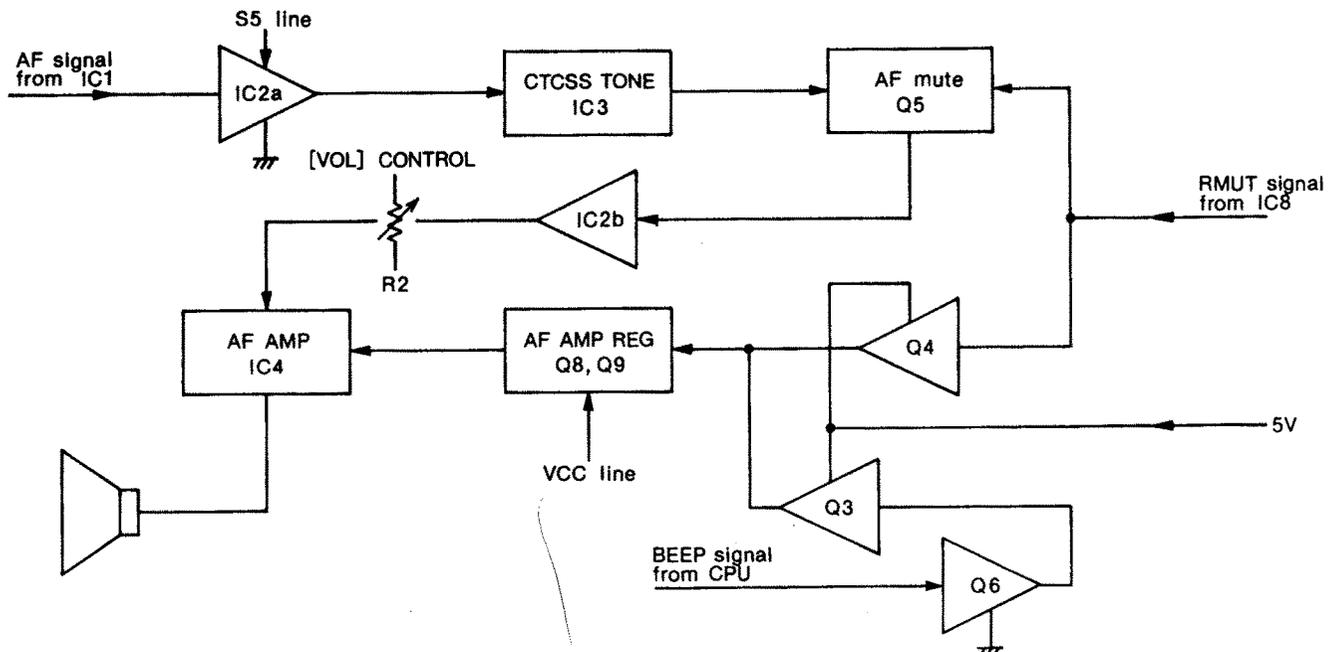

IC12 is a squelch IC that controls attack/release timing. When an operating channel is changed (the "RSTB" signal is received), fast attack timing is selected.

The output signal from IC12 (pin 6) is applied to the CPU (IC1, pin 33) on the LOGIC UNIT as an "SQL" signal. The [S] SWITCH on the VR UNIT will supply the squelch signal to the CPU by controlling Q2.

When the CPU (IC1, pin 33) receives the "SQL" signal, the shift register (IC8, pin 7) on the MAIN UNIT outputs an "RMUT" signal. The AF mute circuit (Q5) is deactivated if the "RMUT" signal is "LOW." At this time, Q4 is turned ON. The AF amplifier regulator (Q8, Q9) supplies sufficient voltage to drive an AF power amplifier (IC4). D5 and R42 suppress the increase output voltage from the AF power amplifier (IC4).

Q6 detects DC voltage included in the beep and DTMF signals in the monitor condition. When Q3 is turned ON, the AF power amplifier (IC4, pin 9) is turned ON while the AF mute circuit (Q5) is activated.

• AF SIGNAL CURRENT

3-2 TRANSMITTER CIRCUITS

3-2-1 MICROPHONE AMPLIFIER CIRCUIT (FRONT, LOGIC AND MAIN UNITS)

The microphone amplifier circuit amplifies audio signals with +6 dB/octave pre-emphasis from the microphone to a level needed for the modulation circuit.

The AF signals from the microphone pass through the microphone mute switch circuit (IC2). The CPU (IC1, pin 37) supplies an "MMUT" to IC2. The AF signals are then applied to IC9a (pin 3) in the MAIN UNIT and pass through the +6 dB pre-emphasis circuit (C71, R53) which is connected to pin 2. IC9a includes a low level amplifier with pre-emphasis and a limiter amplifier. The output signals from IC9a (pin 1) pass through a splatter filter circuit (IC9b) which eliminates signal components greater than 3 kHz. Pin 7 of IC9b outputs a "MOD" signal. The "MOD" signal is applied to the TVCO UNIT as the "MOD1" signal.

3-2-2 MODULATION CIRCUIT (TVCO AND TPLL UNITS)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The "MOD1" signal changes the reactance of varactor diode (D7) to modulate the oscillated signal at TVCO (Q1). The oscillated signal is buffer-amplified at Q2 and Q3.

The signal passes through the low-pass filter and is divided by 4 at a prescaler (IC2, pin 2) on the TPLL UNIT. The resulting signal is output from IC2 (pin 7) and is then applied to the drive amplifier circuit.

3-2-3 DRIVE AMPLIFIER CIRCUIT (RF UNIT)

The drive amplifier circuit amplifies the VCO oscillating signal to the needed level at the power amplifier.

The signal from IC2 (pin 7) on the TPLL UNIT passes through the 3-stage low-pass filter consisting of L14~L16 and C78~C81. The filtered signal is amplified at a pre-drive amplifier (Q7) and re-amplified at a drive amplifier (Q6) to obtain 20 mW.

The control voltage from the APC circuit is applied to the collector of Q6 for stable RF output power from a power amplifier (IC1).

3-2-4 RF POWER AMPLIFIER (RF UNIT)

IC1 is a power module which provides a stable 5 W (DC 13.8 V) of output power.

The RF signal from the drive amplifier (Q6) is applied to the power amplifier (IC1, pin 1). The amplified signal is output from IC1 (pin 5). The output signal is applied to the antenna connector through the APC circuit, the antenna switching circuit and the low-pass filter circuit.

• MICROPHONE AMPLIFIER CIRCUIT

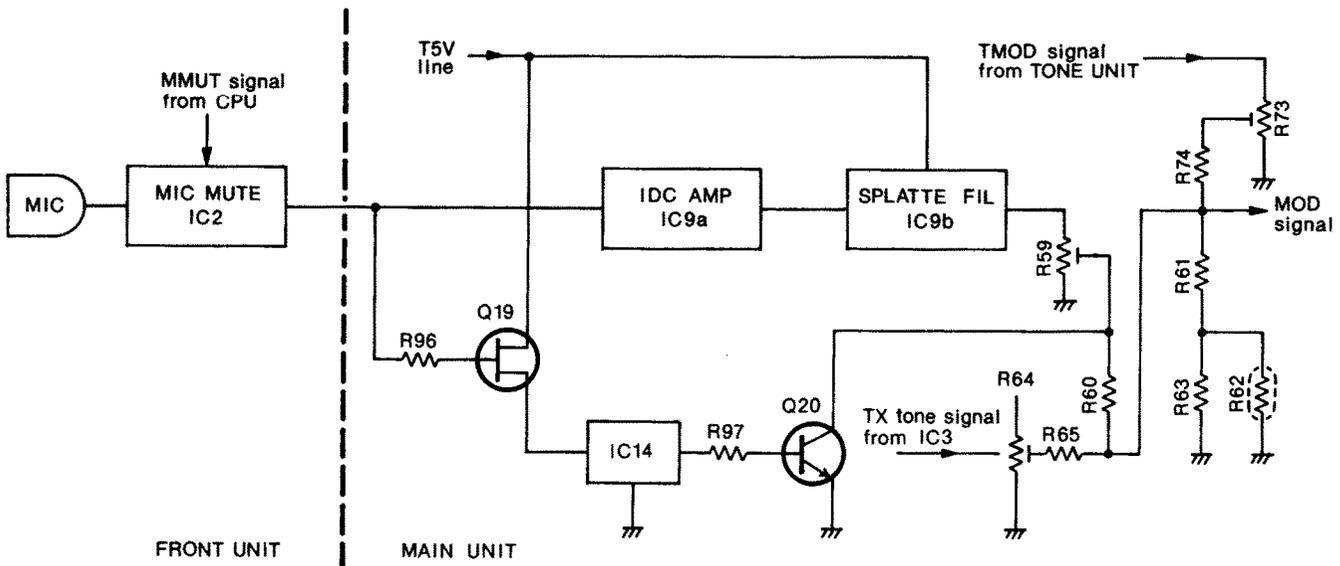

Fig. 3

3-2-5 APC CIRCUIT (RF UNIT)

The APC circuit protects the power module (IC1) from a mismatched output load and selects HIGH or LOW output power.

The output power from the power module (IC1, pin 5) is applied to the APC mismatch detector circuit (L17, R59, R60, C46, C47) to divide high-frequency components for conversion to DC voltage at the APC detector (D13, D14). When the antenna impedance is matched at 50 Ω, the detected voltage is at its minimum. However, when antenna impedance is mismatched, the detected voltage is higher than when it is matched.

The detected voltage is applied to a differential amplifier circuit (Q15, Q16). The APC reference voltage is determined by the power output control circuit (R46~R50) and is then applied to the base of Q15.

When the antenna impedance is mismatched, the base voltage of Q16 exceeds the reference voltage. The collector voltage of Q16 decreases.

The current from the differential amplifier circuit (Q15, Q16) is amplified at Q14 to control Q11 and Q12. The control voltage changes the supply voltage to IC1 and Q6. This decreases the output power from the drive amplifier (Q6) and power module (IC1) until the base voltage of Q16 reaches the same level as the voltage of Q15.

Q19 and Q20 are turned ON when DC 8.4 V is supplied. They control the output power.

3-2-6 POWER OUTPUT CONTROL CIRCUIT (RF UNIT)

The power output control circuit (R46~R50) selects "HIGH" or "LOW" output power levels and controls the RF output power with the APC reference voltage.

When "HIGH" output power is selected, the APC reference voltage is determined by R47, R48 and R50. The RF output power is adjusted with R47.

When "LOW" output power is selected, the "LOW" signal from the shift register (IC8, pin 4) on the MAIN UNIT is applied to R46. The APC reference voltage is determined by R46, R49 and R50. The RF output power is adjusted with R46.

3-2-7 TX MUTE CIRCUIT (RF UNIT)

When a "TMUT" signal from the shift register (IC8, pin 6) on the MAIN UNIT turns Q5 OFF to interrupt the transmission, the bias voltages are prevented from entering Q6, Q7 and IC1.

• APC CIRCUIT

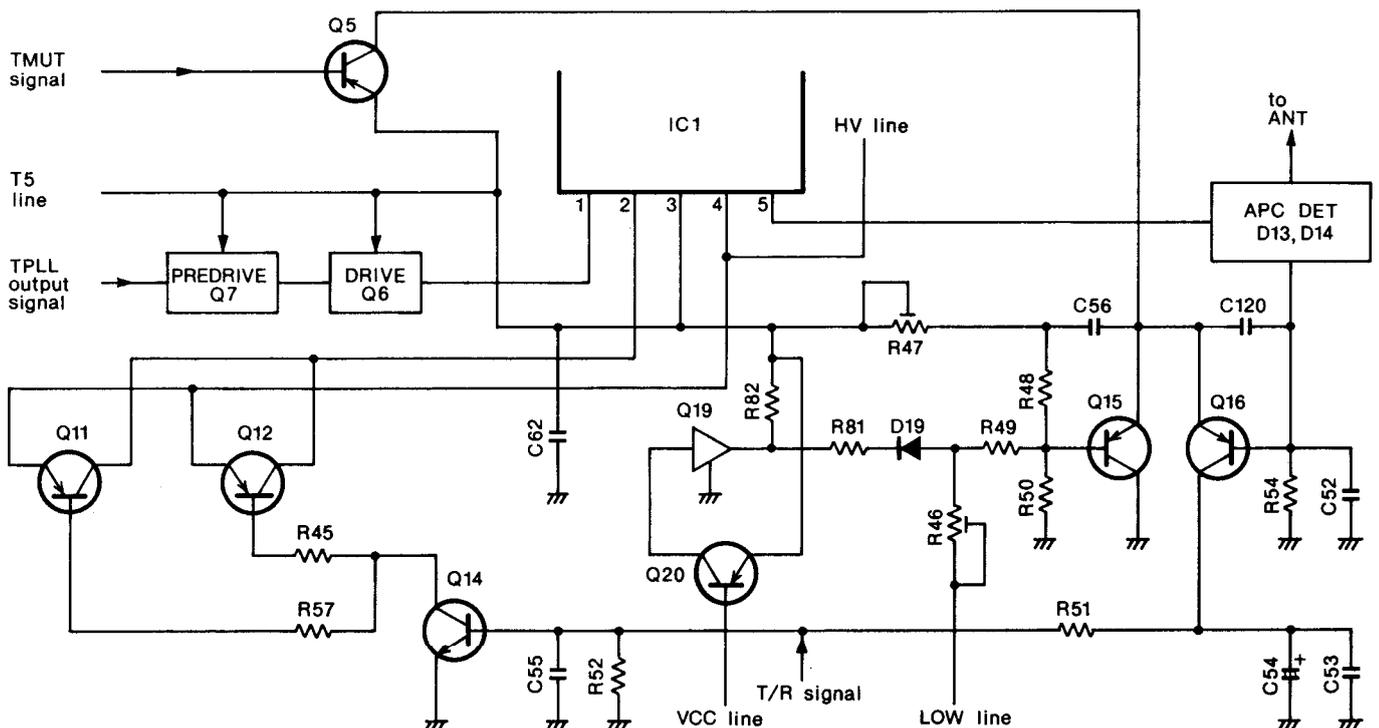

Fig. 4

3-2-8 ANTENNA SWITCHING CIRCUIT (RF UNIT)

The antenna switching circuit applies the received signal to the receiver circuit and the transmitter signal to the antenna connector.

Q17, D15 and D16 are turned ON to form a parallel resonant circuit (L19, C38, C39) while transmitting. The parallel resonant circuit does not allow the RF output signal from IC1 to enter the receiver circuit. The RF output signal from IC1 passes through L17, D15, C45 and C129. The signal is applied to a low-pass filter (L20, L21, C40~C44) and then to an antenna connector. The impedance of the parallel resonant circuit increases. The signal leakage from the resonant circuit is bypassed at D16 and Q17.

3-3 PLL CIRCUITS

3-3-1 GENERAL

This transceiver has an independent PLL circuit (RPLL for the receiver and TPLL for the transmitter) to facilitate high speed changing from receive to transmit.

PLL circuits steadily oscillate the transmit frequency and the 1st LO receive frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

3-3-2 RECEIVER PLL CIRCUIT (RPLL UNIT)

The PLL circuit, using a one-chip modulus prescaler (IC1), directly generates the 1st LO receive frequency with the RVCO (Q2) on the RVCO UNIT. The modulus prescaler (IC1) sets the dividing ratio based on serial data from the CPU (IC1) on the LOGIC UNIT and compares the phase of the RVCO signal with the reference oscillator frequency. The PLL IC (IC1) detects the out-of-step phase and outputs it from IC1 (pins 15 and 16). A reference frequency is oscillated at X1 on the RF UNIT.

3-3-3 REFERENCE OSCILLATOR CIRCUIT (RF UNIT)

A 6.4 MHz reference frequency is produced by Q10 and X1 on the RF UNIT. The frequency is adjusted with C93. D12, R38 and R41 compensate for temperature to maintain frequency stability within ± 5 ppm ($-30^{\circ}\text{C} \sim +60^{\circ}\text{C}$; $-22^{\circ}\text{F} \sim +140^{\circ}\text{F}$). The reference frequency is applied to both the RPLL and TPLL circuits.

3-3-4 RECEIVER VCO CIRCUIT (RVCO UNIT)

The RVCO circuit (Q2, D2) generates the 1st LO receive frequency. The varactor diode (D2) provide frequency control. The output signal from the RVCO circuit is applied to a buffer amplifier (Q1, Q3, Q4) which amplifies VCO oscillation and does not permit the latter circuit to affect the VCO oscillation. The amplified signal enters either PLL IC (IC1, pin 8) on the RPLL UNIT or a buffer amplifier (Q4) on the RF UNIT.

• RPLL CIRCUIT

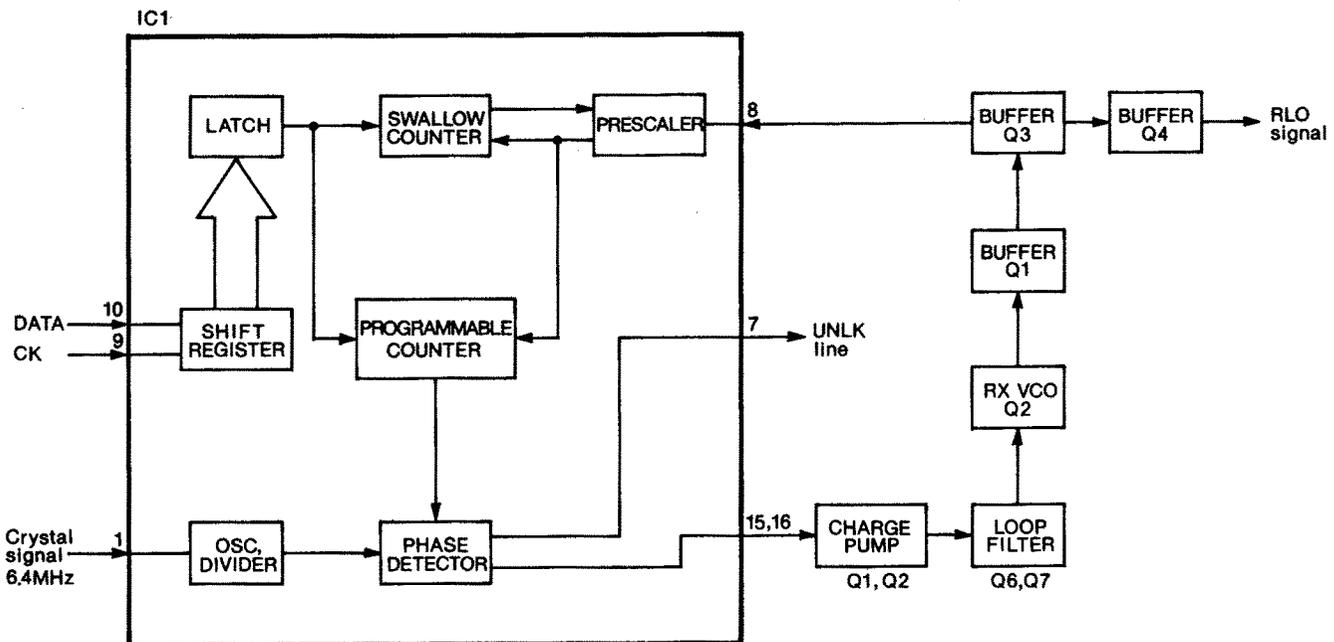

Fig. 5

3-3-5 RECEIVER PROGRAMMABLE DIVIDER AND PHASE DETECTOR CIRCUITS (RPLL UNIT)

The programmable divider shifts the dividing ratio with a prescaler depending on the operating frequency and determines the VCO oscillating frequency.

The phase detector circuit detects the off-phase components of the VCO frequency using a stable reference frequency.

IC1 is a one-chip PLL IC that contains a two-modulus prescaler, a swallow counter, a programmable divider and a phase detector. IC1 accepts up to 520 MHz inputs.

The input signal from the PLL IC (IC1, pin 8) passes through the two-modulus prescaler and the programmable counter sections of IC1. A 6.4 MHz reference frequency from X1 on the RF UNIT is applied to IC1 (pin 1) and passes through a programmable reference counter section of IC1. Both of the divided signals are compared at a phase detector section of IC1. The phase-detected signal (pulse signal) is output from IC1 (pins 15 and 16).

3-3-6 RECEIVER CHARGE PUMP AND LOOP FILTER CIRCUITS (RVCO AND RPLL UNITS)

The phase-detected signal (pulse signal) from IC1 (pins 15 and 16) passes through the charge pump (Q1, Q2) and is then applied to an active loop filter (Q6, Q7) on the RVCO UNIT. The pulse signal is converted to DC voltage (PLL voltage) to control the oscillation from the RVCO UNIT. A charge pump (Q1, Q2) is used to expand the range of the PLL lock voltage. The PLL lock voltage changes the reactance of a varactor diode (D2) in the RVCO circuit.

When transmitting, T5 is applied to D4 on the RVCO UNIT to cut off the receiver 1st LO output from the RVCO UNIT.

• TPLL CIRCUIT

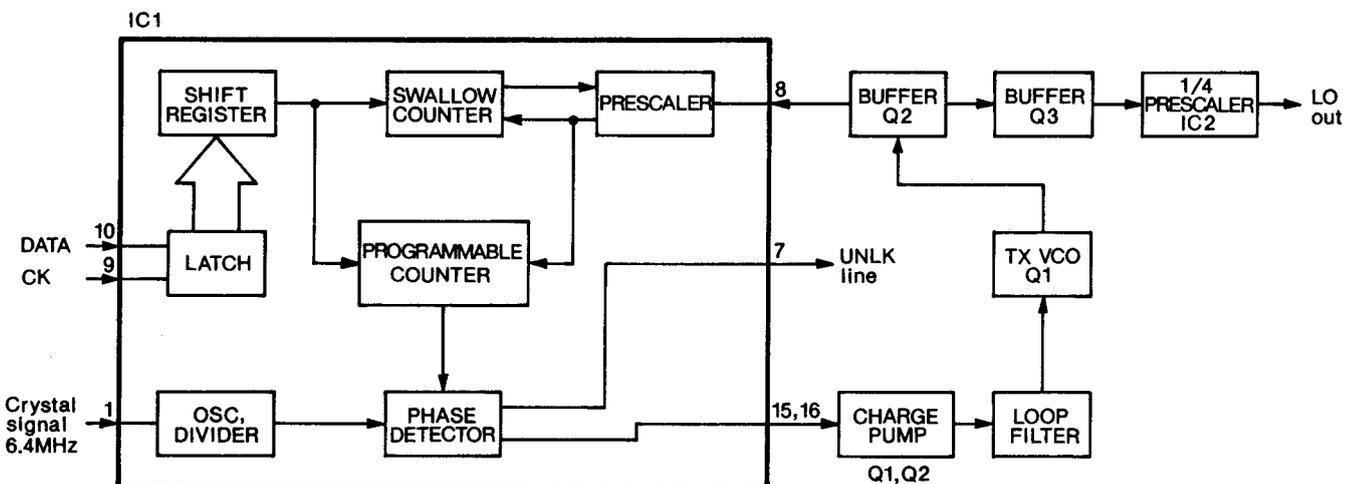

Fig. 6

3-3-7 RECEIVER UNLOCK SENSOR CIRCUIT (RPLL, RF AND LOGIC UNITS)

When the PLL circuit is unlocked, pin 7 of IC1 outputs a pulse signal. The signal is inverted at IC2 on the RF UNIT and is then applied to a time constant (R32, C95). Therefore, the "HIGH" signal is applied to the CPU (IC1, pin 34) as an unlock signal on the LOGIC UNIT.

3-3-8 TRANSMITTER PLL CIRCUIT (TPLL UNIT)

The PLL circuit, using a one-chip modulus prescaler (IC1), directly generates the transmit frequency with a Clapp VCO (Q1) on the TVCO UNIT. The modulus prescaler (IC1) sets the dividing ratio based on serial data from the CPU (IC1) on the LOGIC UNIT and compares the phase of the TVCO signal with the reference oscillator frequency. The PLL IC (IC1) detects the out-of-step phase and outputs it from IC1 (pins 15 and 16). A reference frequency is oscillated at X1 on the RF UNIT.

3-3-9 TRANSMITTER VCO CIRCUIT (TVCO UNIT)

The TVCO circuit (Q1, D1~D4) generates the transmit frequency. Varactor diodes (D1~D4) provide frequency control. Modulation is directly performed by the varactor diode (D7). The output signal from the TVCO circuit is applied to a buffer amplifier (Q2, Q3) which amplifies the VCO oscillation and does not permit the latter circuit to affect the VCO oscillation. The amplified signal enters either PLL IC (IC1, pin 8) or a divide-by-4 prescaler (IC2, pin 2) on the TPLL UNIT.

3-3-10 TRANSMITTER PROGRAMMABLE DIVIDER AND PHASE DETECTOR CIRCUITS (TPLL UNIT)

The programmable divider shifts the dividing ratio with a prescaler, depending on the operating frequency, and determines the VCO oscillating frequency.

The phase detector circuit detects the off-phase components of the VCO frequency using a stable reference frequency.

IC1 is a one-chip PLL IC that contains a two-modulus prescaler, a swallow counter, a programmable divider and a phase detector. IC1 accepts up to 1 GHz inputs.

The input signal from the PLL IC (IC1, pin 8) passes through the two-modulus prescaler and the programmable counter sections of IC1. A 6.4 MHz reference frequency from X1 on the RF UNIT is applied to IC1 (pin 1) and passes through a programmable reference counter section of IC1. Therefore, the reference frequency (5 kHz or 6.25 kHz) is set by the dividing data from the CPU. Both of the divided signals are compared at a phase detector section of IC1. The phase-detected signal (pulse signal) is output from IC1 (pins 15 and 16).

3-3-11 TRANSMITTER CHARGE PUMP AND LOOP FILTER CIRCUITS (TVCO AND TPLL UNITS)

The phase-detected signal (pulse signal) from IC1 (pins 15 and 16) passes through the charge pump (Q1, Q2) and is then applied to a lag-lead loop filter (C1, C2, R1, R2). The pulse signal is converted to DC voltage (PLL voltage) to control the oscillation from the TVCO UNIT. A charge pump (Q1, Q2) is used to expand the range of the PLL lock voltage. The PLL lock voltage changes the reactance of a varactor diode (D1~D4) in the TVCO circuit.

3-3-12 TRANSMITTER UNLOCK SENSOR CIRCUIT (TPLL, RF AND LOGIC UNITS)

When the PLL circuit is unlocked, pin 7 of IC1 outputs a pulse signal. The signal is inverted at IC2 on the RF UNIT and is then applied to a time constant (R32, C95). Therefore, the "HIGH" signal is applied to the CPU (IC1, pin 34) as an unlock signal on the LOGIC UNIT.

3-4 POWER SUPPLY CIRCUITS

3-4-1 VOLTAGE LINES

LINE	DESCRIPTION
HV	The external DC power from the DC power connector.
VCC	This voltage passes through [VOL] control (R2) on the VR UNIT and is then applied to the 5 V regulator circuit (IC5) on the MAIN UNIT. This voltage line changes depending on the battery pack type: 8.4 V (CM-72), 13.8 V (CM-73).
+5 V	Common 5 V converted from the VCC line at the 5 V regulator circuit (Q10, Q11, D6) using IC5 output as the reference voltage on the MAIN UNIT. This regulator circuit is composed of a complementary connection to ensure high current amplification and supplies stable output voltage continuously with good temperature characteristics in all modes.
S5 V	5 V controlled by the power saver function. When the power save is turned ON, a "PSAV" signal from the CPU (IC1, pin 61) on the LOGIC UNIT interrupts the "S5 V" line intermittently to save power. This voltage is converted from the VCC line at Q12, Q13 and D7 using IC11 output as the reference voltage on the MAIN UNIT. This regulator circuit forms a complementary circuit.
R5 V	Receive 5 V controlled by an "S5 V" signal from the S5 V regulator and a "T/R" signal from the shift register (IC8, pin 14) on the MAIN UNIT. This voltage is converted from the VCC line at Q14, Q15 and D8 using IC6 output as the reference voltage. This regulator circuit forms a complementary circuit.
T5 V	Transmit 5 V controlled by a "TMUT" signal from the shift register (IC8, pin 6) on the MAIN UNIT. This voltage is converted from the VCC line at Q16, Q17 and D9 using IC7 output as the reference voltage. This regulator circuit forms a complementary circuit.

3-4-2 CPU POWER SUPPLY CIRCUIT (LOGIC UNIT)

The DC voltage is applied to the 64 K-byte CMOS RAM (IC3, pin 28) via D5 from the lithium backup battery (BT1) to provide backup for the memory contents regardless of the power switch supply.

• CPU POWER SUPPLY CIRCUIT

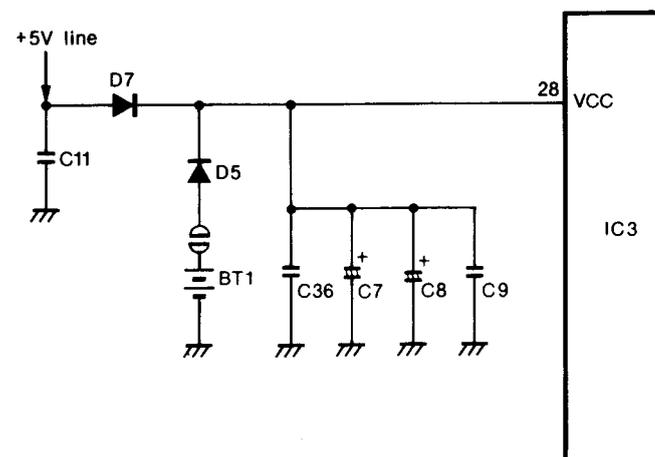

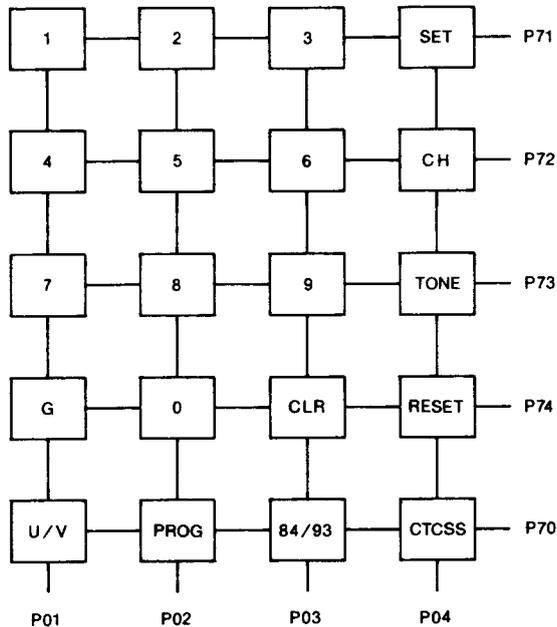

Fig. 7

3-5 LOGIC CIRCUITS

The logic circuit section consists of an 8-bit CPU, an EPROM and a 64 K-byte CMOS RAM. A 5-TONE encoder/decoder unit is equipped on the LOGIC UNIT.

3-5-1 KEY MATRIX FOR CPU INPUT

3-5-2 PORT ALLOCATIONS

• IC1 CPU (LOGIC UNIT)

PORT NAME	PIN NUMBER	DESCRIPTION
LIGHT [P22]	31	Input port for the [LIGHT] switch.
CSTB [P62]	3	Outputs strobe signals for CTCSS.
TSTB [P61]	4	Outputs strobe signals for TX PLL.
RSTB [P60]	5	Outputs strobe signals for RX PLL.
INT1 [P21]	29	Accepts 5-tone data input when this port becomes "HIGH".
FUNC [P24]	32	Input port for the [FUNC] switch. "L": When the scan starts or stops. "H": When the scan function is deactivated. Input port for the cloning switch when the cloning mode is selected.
SQL [P25]	33	Input port for the squelch signal.
UNLK [P26]	34	Input port for the PLL unlock signal.

PORT NAME	PIN NUMBER	DESCRIPTION
BUSY [P27]	35	Input port for the "BUSY" signal from the LCD driver.
SEND [P30]	36	Input port for T/R switching. "L": When transmitting. "H": When receiving. Input port for the receive signal when the cloning mode is selected.
MMUT [P31]	37	Output port for microphone muting. "L": When this function is deactivated. "H": When this function is activated. Outputs the cloning data when the cloning mode is selected.
CK [P32]	38	Outputs a clock signal for PLL, CTCSS and LCD.
DATA [P33]	39	Outputs a data signal for PLL, CTCSS and LCD.
CALL [P75]	44	Input port for the [CALL] switch. "L": When transmitting. "H": When receiving. Input port for the function switch when the SET mode is selected.
S0~S3 [P34~P37]	50~53	I/O ports for 5-tone data.
\bar{C}/D [P05]	59	Outputs a data/command designation signal for the LCD driver.
DET [P67]	62	Input port for the CTCSS tone decoded signal. "L": When this function is deactivated. "H": When decoding a CTCSS tone.
BEEP [P66]	63	Outputs a beep tone signal.
$\bar{W}R$ [P65]	64	Outputs a RAM writing signal.

• IC4 SHIFT REGISTER (TONE UNIT)

PORT NAME	PIN NUMBER	DESCRIPTION
LOW	4	Output port for output power condition. "L": When high power is selected. "H": When low power is selected.
V1, V2	12, 11	Outputs a selecting signal for a 5-tone system.
5STB	13	Outputs strobe signals for a 5-tone IC.
\bar{T}/R	14	Outputs a 5-tone control signal. "L": When encoding. "H": When decoding.

• IC8 SHIFT REGISTER (MAIN UNIT)

PORT NAME	PIN NUMBER	DESCRIPTION
LOW	4	Output port for output power condition. "L": When high power is selected. "H": When low power is selected.
EXC	5	The port becomes "HIGH" when the received 5-tone code matches the programmed 5-tone code.
TMUTE	6	Output port for the transmit muting signal which mutes RF power. "L": When this function is deactivated. "H": When this function is activated.
RMUTE	7	Output port for the receive muting signal which mutes audio power. "L": When this function is deactivated. "H": When this function is activated.
T/R	14	Output port for a transmit/receive signal. The port becomes "LOW" when transmitting.

3-6 5-TONE CIRCUITS

3-6-1 5-TONE IC (TONE UNIT)

IC1* is a gate-array IC consisting of a 5-tone encoder/decoder, a data selector for controlling the CPU, a serial-parallel converter and a divider and inverter for resetting. The following I/O ports are equipped.

*IC1
SC-1093 for the U.K. and France versions.
SC-1084 for all other versions.

PORT NAME	PIN NUMBER	DESCRIPTION
IO0~IO3	61~64	I/O ports for the 5-tone encoder/decoder data.
CON1	60	Output/input control port for the IO0~IO3.
RX	59	Control port which activates either the encoder or decoder.
TO1, TO2	44, 45	Ports which change the 5-tone system. (See below)
ST1	57	Port for a 5-tone encoder strobe signal.
EC0~EC2	41~43	Output ports for the encoder/decoder.
DS	21	Input port for the decoder signal.
ST3	8	Port for a decoder strobe signal.
IN1, IN2	9, 11	Input ports for an inverter.
OUT1, OUT2	10, 12	Output ports for an inverter.
KO3	22	Output port for 560 kHz.
OSC1, OSC2	34,35	Ports for a crystal oscillator.

The 5-tone system depends on the transceiver version and signals from the shift register (IC4), V1 (TO1) and V2 (TO2) as follows:

V1	V2	SC-1084	SC-1093
L	L	EIA	DZVEI
H	L	CCIR	CCIR
L	H	EEA	EEA
H	H	ZVEI	DAPL

The receive audio signal output from IC1 (pin 9) on the MAIN UNIT is applied to the tone encoder/decoder (IC2, pin 20) on the TONE UNIT through the "DISC" signal line. IC2 distinguishes regular signals from those with noise interference. The decode signal is applied to IC1 (pin 21).

3-6-2 5-TONE TRANSMISSION (TONE UNIT)

The data from IC1 is converted from digital to analog at R3~R8 to produce a 5-tone signal. The 5-tone signal is amplified at IC3b. The amplified signal is then applied to an active low-pass filter (IC3a) to eliminate its digital and high harmonic components. The active low-pass filter (IC3a) produces an encode signal without distortion. The output signal from IC3a is applied to the TVCO UNIT as a "TMOD" signal.

Q3 prevents the reference clock signal from entering the tone encoder/decoder while a 5-tone signal is decoding. On the other hand, Q2 turns Q1 ON to supply a voltage to IC3 while a 5-tone signal is encoding.

3-6-3 5-TONE FREQUENCY TABLE

5-TONE CODE	EIA	CCIR	EEA	ZVEI	DZVEI	DAPL
0	600	1981	1981	2400	2200	1981
1	741	1124	1124	1060	970	1124

E=Repeat	459	2110	2110	2600	2400	2110
F	No tone					

3-6-4 DTMF ENCODER CIRCUIT (TONE UNIT)

The DTMF encoder (IC5) is controlled by the serial data from the CPU (IC1) on the LOGIC UNIT. The serial data from the CPU (IC1) is converted to the parallel signal in the 5-tone IC (IC1) to activate the DTMF encoder (IC5).

When the DTMF signal is encoded, the DTMF encoded signal is output from IC5 (pin 20) and is then applied to the amplifier (IC3c). The amplified signal is buffer-amplified at IC3d and is then re-amplified at IC3b. The resulting signal is applied to TVCO UNIT as "TMOD" signal via IC3a. The DTMF encoded signal from IC3c is output from the "DTMF" signal line in the monitor condition.

Pin 12 of IC5 outputs a mute signal to deactivate IC3c and IC3d while a 5-tone signal is encoding.

3-7 OTHER CIRCUITS

3-7-1 CTCSS TONE ENCODER/DECODER CIRCUIT (MAIN UNIT)

The CTCSS tone encoder/decoder (IC3) encodes and decodes 67.0 Hz~250.3 Hz tone frequencies which are set by the serial data from the CPU on the LOGIC UNIT.

IC3 contains a CTCSS tone encoder/decoder, a speech path high-pass filter and a CTCSS tone detector. The tone decoder and speech path high-pass filter have separate inputs and both are protected against the effect of incident RF voltage. The speech high-pass filter has low pass-band ripple, low output noise and a cut-off frequency of 300 Hz regardless of the programmed CTCSS tone.

The AF signal from IC2a (pin 1) is applied to either IC3 (pin 23) or the low-pass filter (IC2c, IC2d). The AF signal input from IC3 (pin 23) passes through the speech pass high-pass filter in IC3 to attenuate a CTCSS tone signal and is then output from IC3 (pin 19).

The low-pass filter (IC2c, IC2d) attenuates the AF signal to obtain a CTCSS tone signal. The tone signal is applied to IC3 (pin 24). Pin 14 of IC3 becomes "HIGH" during a successful decode. Therefore, Q7 supplies a CTCSS tone decoded signal to the CPU (IC1, pin 62).

The tone encoded signal is output from IC3 (pin 16) and is then applied to R64 for modulation adjustment.

3-7-2 T/R CONTROL CIRCUIT (RF UNIT)

A T/R signal from the shift register (IC8, pin 14) on the MAIN UNIT controls Q21 and Q8 to supply a voltage for the TPLL UNIT through the "TS5" signal line and to turn Q14 OFF while receiving.

3-7-3 DC-DC CONVERTER (DC-DC UNIT)

A DC-DC converter (IC1) and L1 form a blocking oscillator circuit which supplies a stable output voltage to the RPLL and TPLL UNITS. The DC voltage is used to obtain wide range lock voltage for the PLL circuits.

SECTION 6 ADJUSTMENT PROCEDURES

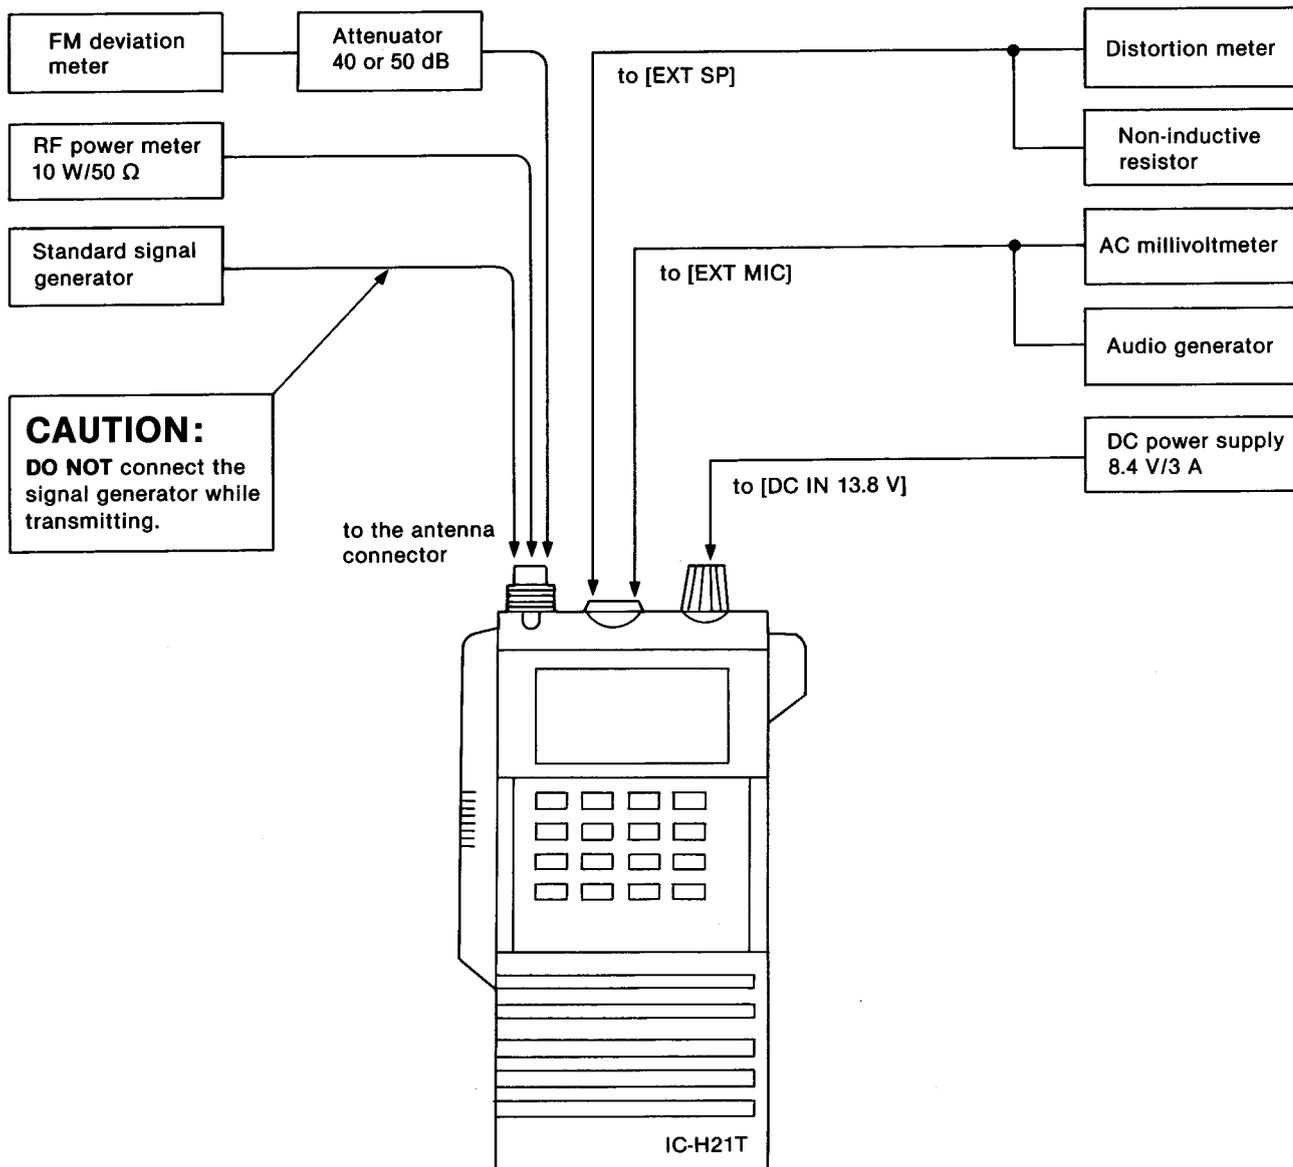

6-1 PREPARATION BEFORE SERVICING

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 8.4 V DC Current capacity : 3 A or more	Audio generator	Frequency range : 300~3000 Hz Output level : 1~200 mV
RF power meter (terminated type)	Measuring range : 1~10 W Frequency range : 120~180 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Attenuator	Power attenuation : 30 or 40 dB Capacity : 10 W or more
Frequency counter	Frequency range : 0.1~180 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	AC millivoltmeter	Measuring range : 2~200 mV
		Non-inductive resistor	Impedance : 8 Ω
Distortion meter	Frequency range : 1 kHz ± 10 Hz Measuring range : 1~100 %	DC voltmeter	Input impedance : 50 kΩ/DC or better
		FM deviation meter	Frequency minimum : 480 MHz Measuring range : 0~±5 kHz
Standard signal generator (SSG)	Frequency range : 0.1~180 MHz Output level : -127~-17 dBm (0.1 μV~32 mV)	Digital multimeter or oscilloscope	Input impedance : 1 MΩ/DC or better

CW: clockwise CCW: counterclockwise CP: check point

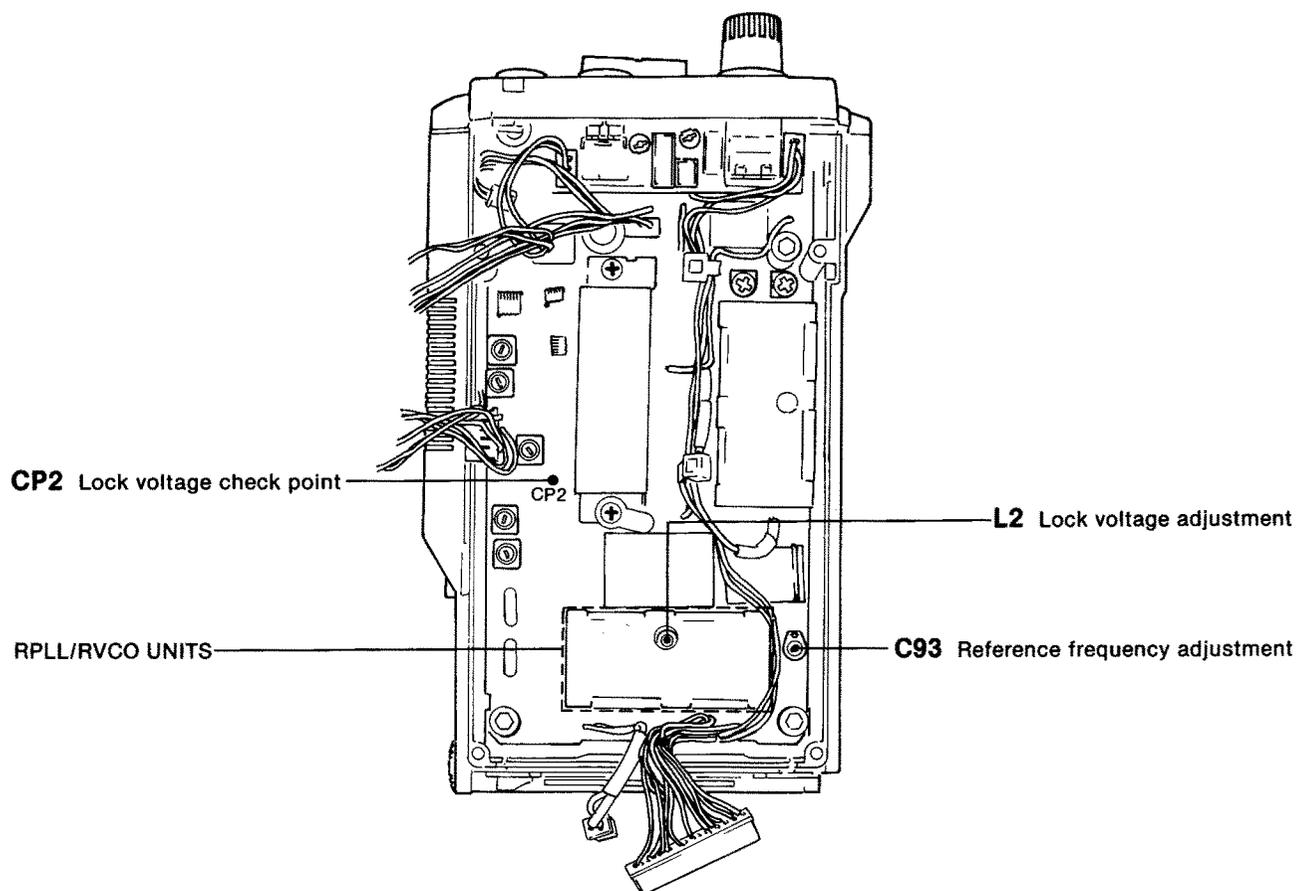

■ CONNECTION

6-2 PLL ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
REFERENCE FREQUENCY	1 <ul style="list-style-type: none"> • Select any channel. • Connect the RF power meter or a 50 Ω dummy load to the antenna connector. • Transmitting 	Top panel	Loosely couple the frequency counter to the antenna connector.	Same frequency as the programmed one. To check the programmed frequency, use the EX-704.	RF	C93
LOCK VOLTAGE	NOTE: Lock voltage affects the C/N ratio. If you adjust the lock voltage, set the frequency with the EX-704.					
	1 <ul style="list-style-type: none"> • Operating frequency: 135.0000 MHz • Receiving 	RF	Connect the digital multimeter or oscilloscope to CP2.	3.0 V	R-VCO	L2

• RF UNIT

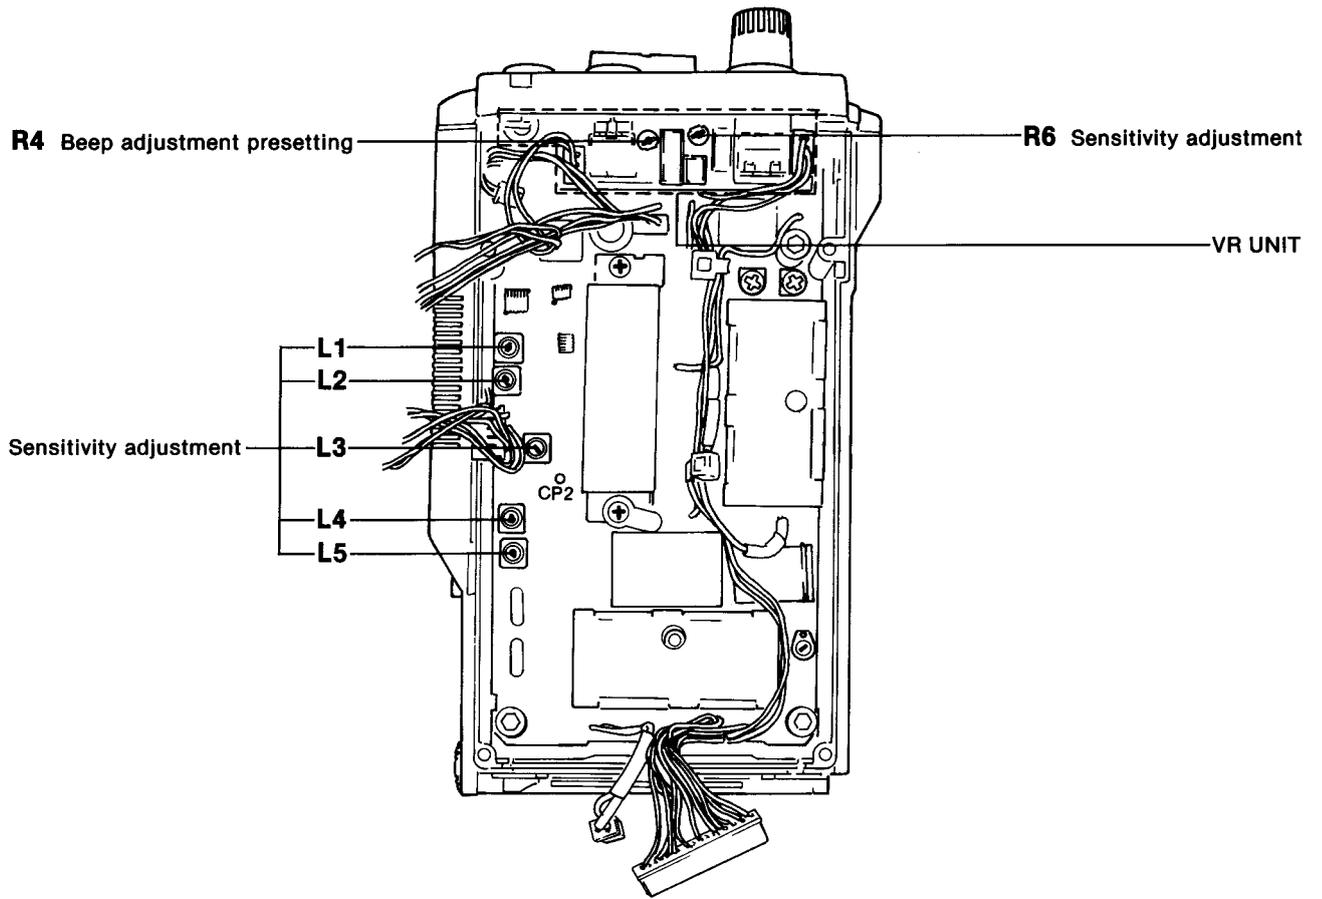

6-3 RECEIVER ADJUSTMENT

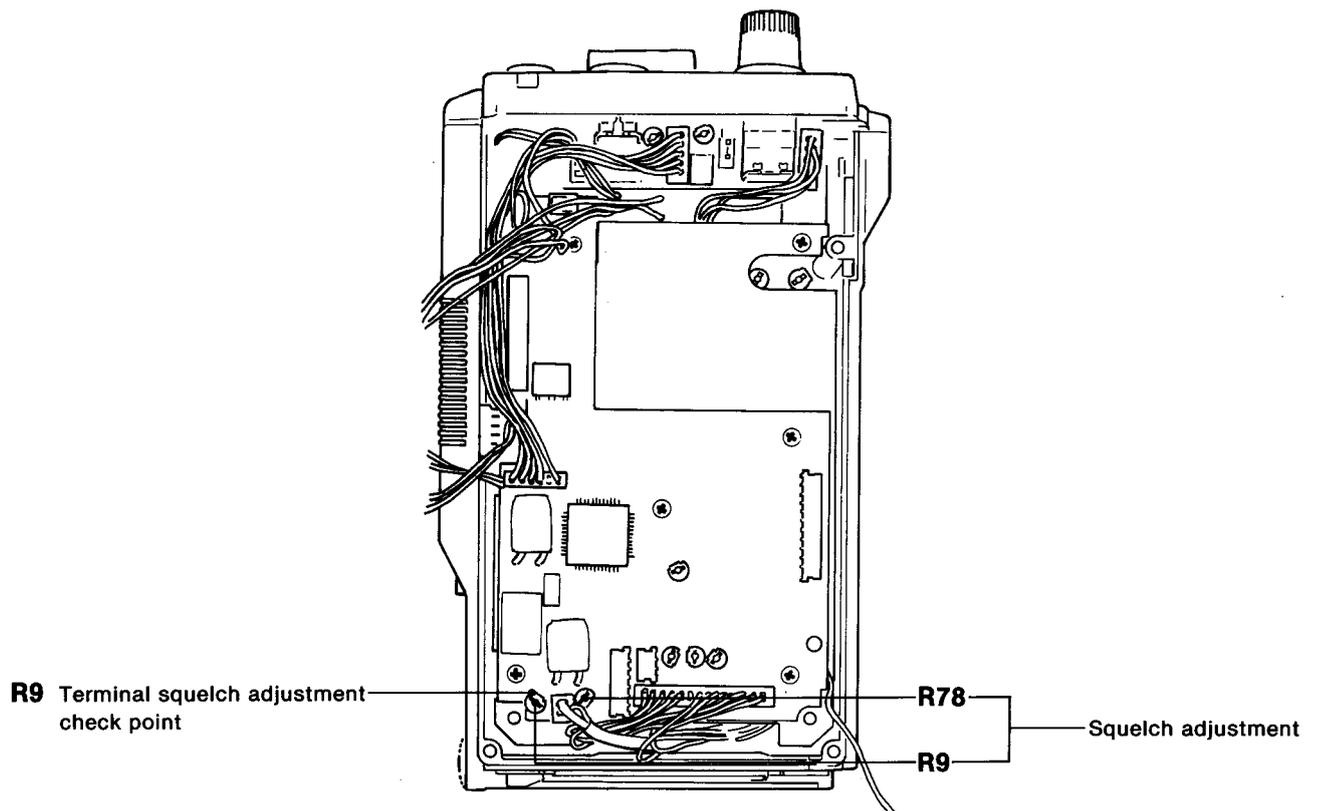

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT		
		UNIT	LOCATION		UNIT	ADJUST	
SENSITIVITY	<p>NOTE: When the sensitivity is less than 0.35 μV (12 dB SINAD) on every channel, the following sensitivity adjustment is not necessary. Skip to squelch adjustment below.</p> <p>This transceiver automatically transmits an answer back code when a 5-tone code is received. Be careful when connecting the SSG to the antenna connector.</p>						
	1	<ul style="list-style-type: none"> Operating frequency: Center of the frequency range. Connect the SSG to the antenna connector and set as: <ul style="list-style-type: none"> Level : 0.35 μV^* (-116 dBm) Modulation: 1 kHz Deviation : ± 3.0 kHz (#02, #04, #06, #09) ± 2.4 kHz (#10) ± 1.5 kHz (All other versions) Receiving 	Top panel	Connect the distortion meter to the [EXT SP] jack with an 8 Ω load.	Minimum distortion level	RF	Adjust in sequence L5, L1, L2, L3, L4
SQUELCH	1	<ul style="list-style-type: none"> Select any channel. Apply no signal to the antenna connector. Receiving 	MAIN	Connect the DC voltmeter to R9 terminal.	1.2 V	MAIN	R9
	2	<ul style="list-style-type: none"> Connect the SSG to the antenna connector and set as: <ul style="list-style-type: none"> Level : 0.18 μV^* (-122 dBm) Modulation: 1 kHz Deviation : ± 3.0 kHz (#02, #04, #06, #09) ± 2.4 kHz (#10) ± 1.5 kHz (All other versions) 	Front panel	Speaker	Squelch just opens.		R78
BEEP	1	<ul style="list-style-type: none"> Select any channel. [VOL] control: Center R4 (VR): CW Receiving 	Front panel	Speaker	Verify that the level of the beep sound is adjustable.	Front panel	[VOL] control

* This output level of the standard signal generator (SSG) is indicated as the SSG's open circuit.
