

SERVICE MANUAL

VHF MARINE TRANSCEIVER

IC-M401E

INTRODUCTION

This service manual describes the latest service information for the **IC-M401E** VHF MARINE TRANSCEIVER at the time of publication.

4 versions of the **IC-M401E** have been designed. This service manual covers each version.

MODEL	VERSION	SYMBOL
IC-M401E	UK, EUR, HOL, FRG	BLACK
	EUR-1	WHITE

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1110003200 S.IC TA31136FN IC-M401E MAIN UNIT 5 pieces
8820001210 Screw 2438 screw IC-M401E Chassis 12 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated turning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB to 50 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

• Frequency coverage	: 156.000–161.450 MHz (Tx) 156.000–163.425 MHz (Rx)
• Mode	: 16K0G3E (FM) 16K0G2B (DSC)
• Power supply requirement	: 13.8 V DC (negative ground)
• Usable temperature range	: –20°C to +60°C
• Frequency stability	: ±10 ppm (–20°C to +60°C)
• Current drain (at 13.8 V DC)	: Transmit at 25 W 5.5 A (max.) Receive max. audio 1.5 A (max.)
• Antenna impedance	: 50 Ω (nominal)
• Input impedance (MIC)	: 2 kΩ
• Output impedance (Audio)	: 4 Ω
• Dimensions (projections not included)	: 153(W)×67(H)×141.6(D) mm
• Weight (approx.)	: 950 g

■ TRANSMITTER

• Output power (at 13.8 V DC)	: High 25 W Low 1 W
• Modulation	: Variable reactance frequency modulation
• Maximum frequency deviation	: ±5.0 kHz
• Spurious emissions	: Less than 0.25 μW
• Adjacent channel power	: More than 70 dB
• Residual modulation	: More than 40 dB
• Audio harmonic distortion	: Less than 10% at 60% deviation
• Audio frequency response	: +1 dB to –3 dB of 6 dB octave from 300 Hz to 3000 Hz

■ RECEIVER

• Receive system	: Double conversion superheterodyne system
• Intermediate frequencies	: 1st 21.7 MHz 2nd 450 kHz
• Sensitivity	: Less than –2 dBμ emf typical at 20 dB SINAD
• Squelch sensitivity	: Less than 0 dBμ emf typical
• Adjacent channel selectivity	: More than 70 dB
• Spurious response	: More than 70 dB
• Intermodulation rejection ratio	: More than 70 dB
• Hum and noise	: More than 40 dB
• Audio frequency response	: +1 dB to –3 dB of –6 dB octave from 300 Hz to 3000 Hz

Specifications are measured in accordance with EN301 025-2, -3

All stated specifications are subject to change without notice or obligation.

SECTION 2 INSIDE VIEWS

• MAIN-E UNIT

• FRONT UNIT

SECTION 3 DISASSEMBLY INSTRUCTIONS

• REMOVING THE CASE

- 1 Unscrew 6 screws, **A**.

Note: When replacing the screw, 10–12 kg of torque **MUST** be applied to ensure water resistance.

- 2 Slide the case free of the chassis in the direction of the arrow.

• REMOVING THE MAIN-E UNIT

- 1 Remove the shield covers, MP31 and MP33.
- 2 Unsolder the antenna connector, **B** (1 point).
- 3 Unsolder bottom side [A] (6 points), and side [B] (1 point), as shown below.
- 4 Unscrew 2 screws, **C**, and 6 screws, **D**, to remove the MAIN-E unit.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT (MAIN-E UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and as resonator circuit while transmitting. The circuit does not allow transmit signals to enter receiver circuits.

Received signals enter the MAIN-E unit from the antenna connector and pass through the low-pass filter (L21, L22, C127, C130, C133). The signals are then applied to the RF circuit via the antenna switching circuit (D14, D21, L31, C141, C142).

4-1-2 RF CIRCUIT (MAIN-E UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit pass through a tunable bandpass filter (D25, L35, C150, C152) where the object signals are applied to the RF amplifier circuit (Q21).

The amplified signals at Q21 are applied to the 3-stage tunable bandpass filter (D26-D28, L36, L38, L39, C161, C162, C164, C173-C178) to suppress unwanted signals and improve the selectivity. The signals are then applied to the 1st mixer circuit (Q22).

4-1-3 1ST MIXER AND 1ST IF CIRCUITS (MAIN-E UNIT)

The 1st mixer circuit converts the received signal to a fixed frequency of the 1st IF signal with a 1st LO (VCO output) frequency. By changing the 1st LO frequency, only the desired frequency will be passed through two crystal filters at the next stage of the mixer.

The signals from the RF circuit are mixed with the VCO signals at the 1st mixer circuit (Q22) to produce a 21.7 MHz 1st IF signal.

The 1st IF signal is applied to two crystal filters (F11, F12) to suppress out-of-band signals and is then amplified at the IF amplifier (Q23). The amplified signal is applied to the 2nd mixer circuit (IC2).

4-1-4 2ND IF AND DEMODULATOR CIRCUITS (MAIN-E UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The FM IF IC (IC2) contains the 2nd local oscillator, 2nd mixer, limiter amplifier, quadrature detector, and noise detector circuits, etc.

The 1st IF signal from Q23 is applied to the 2nd mixer section of IC2 (pin 16), and is mixed with a 21.25 MHz 2nd LO signal generated at the PLL circuit using the reference frequency (21.25 MHz) to produce a 450 kHz 2nd IF signal.

The 2nd IF signal from IC2 (pin 3) is passed through the ceramic filter (F13), where unwanted signals are suppressed, and is then applied to the 2nd IF (limiter) amplifier in IC2 (pin 5). The signal is applied to the FM detector section in IC2 for demodulation into AF signals.

The FM detector circuit employs a quadrature detection method (linear phase detection), which uses a ceramic discriminator (X2) for phase delay to obtain a non-adjusting circuit. The detected signal from IC2 (pin 9) is applied to the AF circuit.

• 2ND IF AND DEMODULATOR CIRCUITS

4-1-5 AF AMPLIFIER CIRCUIT (MAIN-E AND FRONT UNITS)

The AF amplifier circuit amplifies the detected signals to drive a speaker. The AF circuit includes an AF mute circuit for the squelch.

AF signals from IC2 (pin 9) are applied to the de-emphasis circuit (R231, C232). The de-emphasis circuit is an integrated circuit with frequency characteristic of -6 dB/octave.

The integrated signals pass through the bandpass filter (Q31, R232, R234–R237, C233, C234) to suppress unwanted noise signals.

The filtered signals are applied to the AF mute circuit (IC4), and then passes through the [VOLUME] control (VR board; R1) via the "VOL1" signal. The signals are applied to the AF power amplifier (IC9, pin 1). The output signal from IC9 (pin 4) drives the internal (external) speaker.

4-1-6 SQUELCH CIRCUIT (MAIN-E UNIT)

A squelch circuit cuts out AF signals when no RF signals are received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switch.

A portion of the AF signals from the FM IF IC (IC2, pin 9) pass through the squelch adjustment pot (R214), and are then applied to the active filter section (IC2, pin 8). The active filter section filters and amplifies noise components. The amplified signals are converted into the pulse-type signals at the noise detector section. The detected signals outputs from pin 14 as the "SQL" signal.

The "SQL" signal from the FM IF IC is applied to the CPU (LOGIC-E board; IC1, pin 90). The CPU analyzes the noise condition and outputs as the "RMUTM" signal to the AF mute switch (IC4).

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT (MAIN-E UNIT)

The microphone amplifier circuit amplifies audio signals with $+6$ dB/octave pre-emphasis from the microphone to a level needed at the modulation circuit.

The AF signals from the microphone are amplified at the microphone amplifier (IC7, pins 6, 7) via the analog switch (IC4, pins 5, 6). A capacitor (C302) and resistor (R303) are connected to the amplifier to obtain the pre-emphasis characteristics.

The amplified signals are passed through the MIX circuit (IC7, pins 1, 2) to do amplitude limiting, and are then applied to the splatter filter (IC8, pins 1, 3) to suppress unwanted 3 kHz or higher signals. The filtered signals are then applied to the modulation circuit.

4-2-2 MODULATION CIRCUIT (MAIN-E UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

Audio signals from the splatter filter (IC8, pins 1, 3) pass through the frequency deviation adjustment pot (R327) and are then applied to the modulation circuit (D3, D4) to change the reactance of D3, D4 and modulate the oscillated signal at the VCO (Q4, Q5).

4-2-3 DRIVE AMPLIFIER CIRCUIT (MAIN-E UNIT)

The drive amplifier circuit amplifies the VCO oscillating signal to a level needed at the power amplifier.

The VCO output is buffer-amplified by Q6 and Q7, and is then applied to the Tx/Rx switch (D7). The transmit signal from the Tx/Rx switch is amplified to the pre-drive (Q10) and YGR (Q12) amplifiers to obtain an approximate 50 mW signal level. The amplified signal is then applied to the RF power amplifier (IC3).

• AF AMPLIFIER CIRCUIT

4-2-4 POWER AMPLIFIER CIRCUIT (MAIN-E UNIT)

The power amplifier circuit amplifies the driver signal to an output power level.

IC3 is a power module which has amplification output capabilities of about 35 W with 50 mW input. The output from IC3 (pin 4) is passed through the antenna switching circuit (D14) and is then applied to the antenna connector via the low-pass filter.

4-2-5 APC CIRCUIT (MAIN-E UNIT)

The APC circuit stabilizes transmit output power.

The RF output signal from the power amplifier (IC3; pin 4) is detected at the power detector circuit (D12, D13, L19, C121, C124) and is then applied to one of the differential amplifier inputs (Q16, pin 5) via the High/Low control circuit (Q17, R114). The applied voltage controls the differential amplifier output (Q16, pin 2) and the bias voltage control (Q13). Thus the APC circuit maintains a constant output power.

4-3 PLL CIRCUITS

4-3-1 GENERAL

The PLL circuit provides stable oscillation of the transmit frequency and receive 1st LO frequency. The PLL circuit compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by a crystal oscillator and the divided ratio of the programmable divider.

IC1 on the MAIN-E unit is a dual PLL IC which controls both VCO circuits for Tx and Rx, and contains a prescaler, programmable counter, programmable divider, phase detector, charge pump, etc.

The PLL circuit, using a one chip PLL IC (MAIN-E unit; IC1), directly generates the transmit frequency and receive 1st IF frequency with VCOs. The PLL sets the divided ratio based on serial data from the CPU on the LOGIC-E board and compares the phases of VCO signals with the reference oscillator frequency. The PLL IC detects the out-of-step phase and output from pins 8 for Tx and Rx. The reference frequency (21.25 MHz) is oscillated at X1 (MAIN-E unit).

• APC CIRCUIT

• PLL CIRCUIT

4-3-2 TX AND RX LOOP (MAIN-E UNIT)

The generated signal at the VCO (Q4, Q5, D3, D4) enters the PLL IC (IC1, pin 2) and is divided at the programmable divider section and is then applied to the phase detector section.

The phase detector compares the input signal with a reference frequency, and then outputs the out-of-phase signal (pulse-type signal) from pin 8.

The pulse-type signal is converted into DC voltage (lock voltage) at the loop filter (R7–R9, R41, C4, C5, C43, C44), and is then applied to varactor diodes (D3, D4) of the VCO to stabilize the oscillated frequency.

4-3-4 VCO CIRCUIT (MAIN-E UNIT)

The VCO outputs from Q4, Q5 are buffer-amplified at the buffer amplifiers (Q6 and Q7), and are then sent to the Tx/Rx switch (D7 and D8). The receive LO signal is applied to the 1st mixer circuit (Q22) through a low-pass filter, and the transmit signal is applied to the pre-drive amplifier (Q10). A portion of the VCO output is reapplied to the PLL IC (IC1, pin 2) via the buffer amplifier (Q3).

4-4 ATIS AND DSC CIRCUITS

4-4-1 ATIS ENCODE CIRCUIT

(LOGIC-E BOARD AND MAIN-E UNIT)

The FSK signal of ATIS created at CPU (LOGIC-E board; IC1) is passed through the ladder type D/A convertor (R41–R56) to convert into the analog signal. The analog signal is applied to the buffer amplifier (LOGIC-E board; IC9), and then applied to the mixer circuit (MAIN-E unit; IC7, pins 1, 2) to mix with signals from the microphone. The signal passes through the low-pass filter (MAIN-E unit; IC8, pins 1, 3) and is then applied to the VCO circuit as modulation signal.

4-4-2 DSC ENCODE CIRCUIT (MAIN-E UNIT)

The DSC signal created at the optional DSC controller (DS-100) is applied to the T1 via the J7, and then as floating system output. The signal is applied to the buffer amplifier (Q61), and then passes through the 6 dB/oct pre-emphasis circuit (R417, C416). The signal is applied to the mixer circuit (IC7, pins 1, 2) to mix with signals from the microphone. The signal passes through the low-pass filter (IC8, pins 1, 3) and is then applied to the VCO circuit as modulation signal.

4-5 LOGIC CIRCUITS (LOGIC-E BOARD)

• CPU

IC1 is an 8 bit signal chip micro-computer and contains LCD driver, serial I/O, timer, A/D converter, programmable I/O, ROM and RAM.

• SYSTEM CLOCK CIRCUIT

X1 is a ceramic oscillator and oscillate 9.8304 MHz system clock for the CPU (IC1).

• RESET CIRCUIT

IC2 is a reset IC. When turn power ON, IC2 outputs a reset signal ("LOW" pulse) to the CPU (IC1, pin 15) via the "RES" line.

• LOW BATTERY DETECTOR

VCC voltage is divided by R84, R85 and is applied to the low battery detector section in the CPU (IC1, pin 91) via the "LBAT" line.

• DIMMER CIRCUIT

The CPU (IC1), Q1, Q2 and Q3 are dimmer circuit and control the 4 steps the LCD backlight (DS2–DS7).

4-6 POWER SUPPLY CIRCUITS

VOLTAGE LINES

LINE	DESCRIPTION
HV	The voltage from the connected DC power supply.
HVS	Same voltage as the HV line which is passed through the [PWR] switch (VR unit; R1).
VCC	Same voltage as the HVS line. The voltage is applied to the optional DSC controller (DS-100).
5V	Common 5 V converted from the VCC line at the 5V regulator circuit (MAIN-E unit; IC10).
T5	Transmit 5 V controlled by the T5 control circuit (MAIN-E unit; Q52, Q57) using the "SEND" signal from the CPU (LOGIC-E board; IC1). The controlled voltage is applied to the transmitter circuit.
R5	Receive 5 V controlled by the R5 control circuit (MAIN-E unit; Q53, Q54) using the "RCV" signal from the CPU (LOGIC-E board; IC1). The controlled voltage is applied to the receiver circuit.
R8	Receive 8 V controlled by the R5 control circuit (MAIN-E unit; Q55, Q56) using the "R5" signal. The controlled voltage is applied to the receiver circuit.

4-7 PORT ALLOCATIONS**4-7-1 CPU (LOGIC-E BOARD; IC1)**

Pin number	Port name	Description									
1 2	CONT1 CONT2	Outputs control signal for the LCD contrast. <table border="1"> <thead> <tr> <th>CONT1</th> <th>CONT2</th> <th>CONTRAST</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>LIGHT</td> </tr> <tr> <td>1</td> <td>1</td> <td>DEEP</td> </tr> </tbody> </table>	CONT1	CONT2	CONTRAST	0	0	LIGHT	1	1	DEEP
CONT1	CONT2	CONTRAST									
0	0	LIGHT									
1	1	DEEP									
3	BEEP	Outputs beep audio signal.									
5	CH16	Input port for the CH16 switch. Low: While CH16 switch is pushed.									
6	CH	Input port for the CH switch. Low: While CH switch is pushed.									
7	H/L	Input port for the H/L switch. Low: While H/L switch is pushed.									
8	HANG	Input port for the MIC hanging signal. Low: While MIC is pull-up.									
16	PCK	Outputs clock signal to the PLL IC (MAIN-E unit; IC1, pin 4).									
17	PSTB	Outputs strobe signals to the PLL IC (MAIN-E unit; IC1, pin 3).									
18	PDATA	Outputs data signals to the PLL IC (MAIN-E unit; IC1, pin 5).									
20	ICFC	Outputs control signal to switch NMEA or ICF3.									
21	BPLVL	Outputs beep volume control signal. Low: Beep audio is maximum.									
22	ECK	Outputs clock signal for the EEPROM (LOGIC-E board; IC2, pin 6).									
23	EDA	I/O port for the EEPROM data signals.									
27	HI/LO	Output port for RF output power (High or Low) select signal.									
28	RRXD	Input port for the cloning data.									
29	RTXD	Output port for the cloning data.									
31	BPFV	Outputs bandpass filter select signals. Low: Receiving more than 160 MHz. High: Receiving less than 160 MHz.									
83	TMUT	Outputs transmit mute signal. High: While transmitting.									
84	NMEAI	Input port for DS-100 data.									
89	SQLV	Input port for the squelch volume level.									
90	SQL	Input port from the FM IF IC (MAIN-E unit; IC2) for the squelch operation.									
91	LBAT	Input port for the connected power supply voltage detection (low battery indicator).									
92	TXDET	Input port for TX LED control signal.									

Pin number	Port name	Description
93	KEYM	Input port for the HM-132 functions. 2.02 V: [▲] is pushed. 3.00 V: [▼] is pushed. 3.84 V: [16/C] is pushed.
94	PTT	Input port for the PTT switch from HM-132. Low: While PTT is pushed.
95	TAG	Input port for the TAG switch. Low: While TAG switch is pushed.
96	SCN	Input port for the SCN switch. Low: While SCN switch is pushed.
97	UP	Input port for the UP switch. Low: While UP switch is pushed.
98	DN	Input port for the DOWN switch. Low: While DOWN switch is pushed.
99	UNLK	Input port for the PLL unlock signal. Low: While PLL is locked.

4-7-2 I/O EXPANDER IC (LOGIC-E BOARD; IC3)

Pin number	Port name	Description
4	RMUTM	Outputs the AF mute switch (MAIN-E unit; IC4) control signal. Low: While squelched
6	PTTM	Outputs main microphone (HM-132) select signal to the analog switch (MAIN-E unit; IC4).
13	SEND	Outputs the T5 regulator (MAIN-E unit; Q52, Q57) control signal. High: While transmitting
14	RCV	Outputs the R5 regulator (MAIN-E unit; Q53, Q54) control signal. High: While receiving.

SECTION 5 ADJUSTMENT PROCEDURES

5-1 PREPARATION

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 10 A or more	Audio generator	Frequency range : 300–3000 Hz Measuring range : 1–500 mV
RF power meter (terminated type)	Measuring range : 1–50 W Frequency range : 100–300 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Standard signal generator (SSG)	Frequency range : 0.1–300 MHz Output level : 0.1 μV–32 mV (–127 to –17 dBm)
Frequency counter	Frequency range : 0.1–300 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	Oscilloscope	Frequency range : DC–20 MHz Measuring range : 0.01–20 V
FM deviation meter	Frequency range : 30–300 MHz Measuring range : 0 to ±10 kHz	AC millivoltmeter	Measuring range : 10 mV–10 V
DC voltmeter	Input impedance : 50 kΩ/V DC or better	External speaker	Input impedance : 4 Ω Capacity : 5 W or more
Digital multi-meter	Input impedance : 10 MΩ/V DC or better	Attenuator	Power attenuation : 40 or 50 dB Capacity : 50 W or more
Distortion meter	Frequency range : 1 kHz ±10 % Measuring range : 1–100 %	Dummy load	Resistance : 50 Ω Capacity : 100 W or more

■ CONNECTIONS

5-2 PLL ADJUSTMENTS

ADJUSTMENT	ADJUSTMENT CONDITION	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
LOCK VOLTAGE	1 • Operating channel : ch16 • Receiving	MAIN-E	Connect a digital multi-meter or oscilloscope to the check point CP1.	1.8 V		Verify
	2 • Operating channel : ch16 • Output power : Low • Transmitting			1.6 V		
REFERENCE FREQUENCY	1 • Operating channel : ch16 • Output power : Low • Connect an RF power meter or a 50 Ω dummy load to the antenna connector. • Transmitting	Rear Panel	Loosely couple the frequency counter to the antenna connector.	156.8000 MHz	MAIN	C12

5-3 TRANSMITTER ADJUSTMENTS

ADJUSTMENT	ADJUSTMENT CONDITION	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
OUTPUT POWER	1 <ul style="list-style-type: none"> • Operating channel : ch16 • Output power : High • Transmitting 	Rear Panel	Connect an RF power meter to the antenna connector.	23 W	MAIN	R114
FREQUENCY DEVIATION	1 <ul style="list-style-type: none"> • Operating channel : ch16 • Output power : Low • Connect an audio generator to J4 (pin 3) on the MAIN-E unit with an AC millivoltmeter and set as: <ul style="list-style-type: none"> Frequency : 1 kHz Level : 30 mV • Set an FM deviation meter as: <ul style="list-style-type: none"> HPF : OFF LPF : 20 kHz De-emphasis : OFF Detector : (P-P)/2 • Transmitting 	Rear Panel	Connect an FM deviation meter to the antenna connector through an attenuator.	±4.3 kHz	MAIN	R327

5-4 RECEIVER ADJUSTMENTS

ADJUSTMENT	ADJUSTMENT CONDITION	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
SENSITIVITY	1 <ul style="list-style-type: none"> • Operating channel : ch16 • [SQUELCH] control: <ul style="list-style-type: none"> Max. counterclockwise • Connect an SSG to the antenna connector and set as: <ul style="list-style-type: none"> Frequency : 156.800 MHz Level : 3.2 μV* (-97 dBm) Modulation : 1 kHz Deviation : ±3.5 kHz • Receiving 	MAIN-E	Connect a DC voltmeter to the check point CP3.	Maximum voltage	MAIN-E	L35, L36 L38, L39
SQUELCH	1 <ul style="list-style-type: none"> • Operating channel : ch16 • [SQUELCH] control: <ul style="list-style-type: none"> Max. counterclockwise • Connect an SSG to the antenna connector and set as: <ul style="list-style-type: none"> Frequency : 156.800 MHz Level : 0.4 μV* (-115 dBm) Modulation : 1 kHz Deviation : ±3.5 kHz • Receiving 	MAIN-E	Connect a DC voltmeter to the check point CP5.	0.8 V	MAIN-E	R214

*This output level of a standard signal generator (SSG) is indicated as SSG's open circuit.
