

# SERVICE MANUAL

## IC-M700TY

HF TRANSCEIVER

ICOM INCORPORATED

## INTRODUCTION

This service manual contains information relative to the theoretical, physical, mechanical and electrical characteristics of the **IC-M700TY** HF TRANSCEIVER.

## ASSISTANCE

If you require assistance or further information regarding the operation and capabilities of the **IC-M700TY**, please contact your nearest authorized ICOM Dealer or ICOM Service Center.

## ORDERING PARTS

For the fastest service, supply all of the following information when ordering parts from your dealer or ICOM Service Center:

1. Equipment model and serial number
2. Schematic part identifier (e.g., IC1012, Q801)
3. Printed circuit board name and number (e.g., FILTER UNIT/B-888C)
4. Part number and name (e.g., 2SC1971 Transistor)
5. Quantity required

## SECTION 1 SPECIFICATIONS

### 1-1 GENERAL

Frequency coverage	: Receive : 1.6MHz~23.9999MHz Transmit: 2.0MHz~ 2.9999MHz 4.0MHz~ 4.9999MHz 6.0MHz~ 6.9999MHz 8.0MHz~ 8.9999MHz 12.0MHz~13.9999MHz 16.0MHz~17.9999MHz 22.0MHz~22.9999MHz
Frequency control	: CPU based 100Hz step digital PLL synthesizer. Independent transmit/receive frequency programmable on any band.
Frequency readout	: 6 digit 100Hz readout
Frequency stability	: Less than $\pm 10$ Hz in the range $-30^{\circ}\text{C}\sim +60^{\circ}\text{C}$
Memory channel capacity	: 64 simplex or semi-duplex channels (owner programmable)
Power supply requirements	: DC 13.6V $\pm 15\%$ (negative ground) Current drain 30A max. AC power supply available for AC operation.
Current Drain	: Receiving Standby : 1.2A Max. audio output: 1.6A Transmitting Maximum : 30A
Antenna impedance	: 50 ohms unbalanced
Weight	: 7.3kg (16.1 lb)
Dimensions	: 287(297)mm (W) $\times$ 112(124)mm (H) $\times$ 356(376)mm (D) Bracketed values include projections.

### 1-2 TRANSMITTER

Emission modes	: J3E (A3J) USB, LSB H3E (A3H) AM A1A (A1) CW F1A (F1) FSK
RF output power	: 150W
Spurious emissions	: 65dB below peak power output.
Carrier suppression	: 50dB
Unwanted sideband	: $-55$ dB with 1000Hz AF input.
Microphone	: 600 $\Omega$ , noise cancelling microphone with push-to-talk switch.

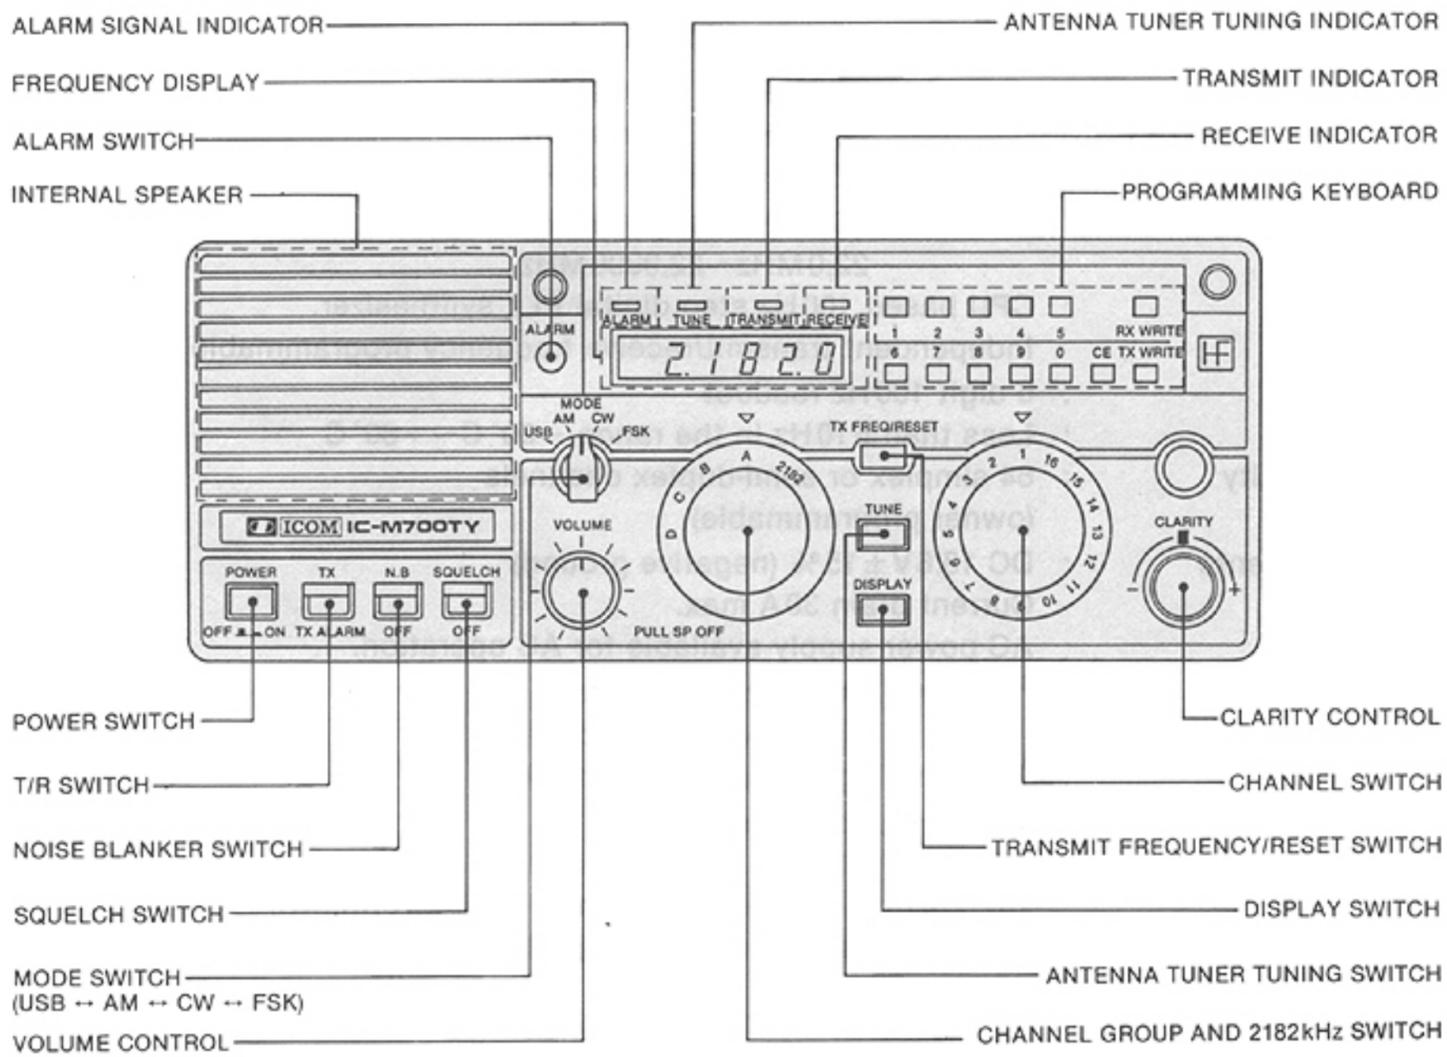

### 1-3 RECEIVER

Receive system	: Double conversion superheterodyne
Receive modes	: J3E (A3J) USB, LSB A3E (A3) AM A1A (A1) CW F1A (F1) FSK
Intermediate frequencies	: SSB, CW, FSK 1st 70.4515MHz 2nd 9011.5kHz AM 70.4500MHz 9010.0kHz
Sensitivity	: SSB, CW, FSK 0.5 $\mu\text{V}$ for 12dB SINAD AM 2.0 $\mu\text{V}$ for 12dB SINAD
Selectivity	: SSB 2.3kHz/ $-6$ dB, 4.2kHz/ $-60$ dB AM 6.0kHz/ $-6$ dB, 20.0kHz/ $-60$ dB CW, FSK* 0.5kHz/ $-6$ dB, 1.6kHz/ $-60$ dB
Spurious and image rejection	: 70dB
Clarity control range	: $\pm 150$ Hz
Audio output	: 5W into 4 $\Omega$ with 10% distortion
AF output impedance	: 2~8 $\Omega$

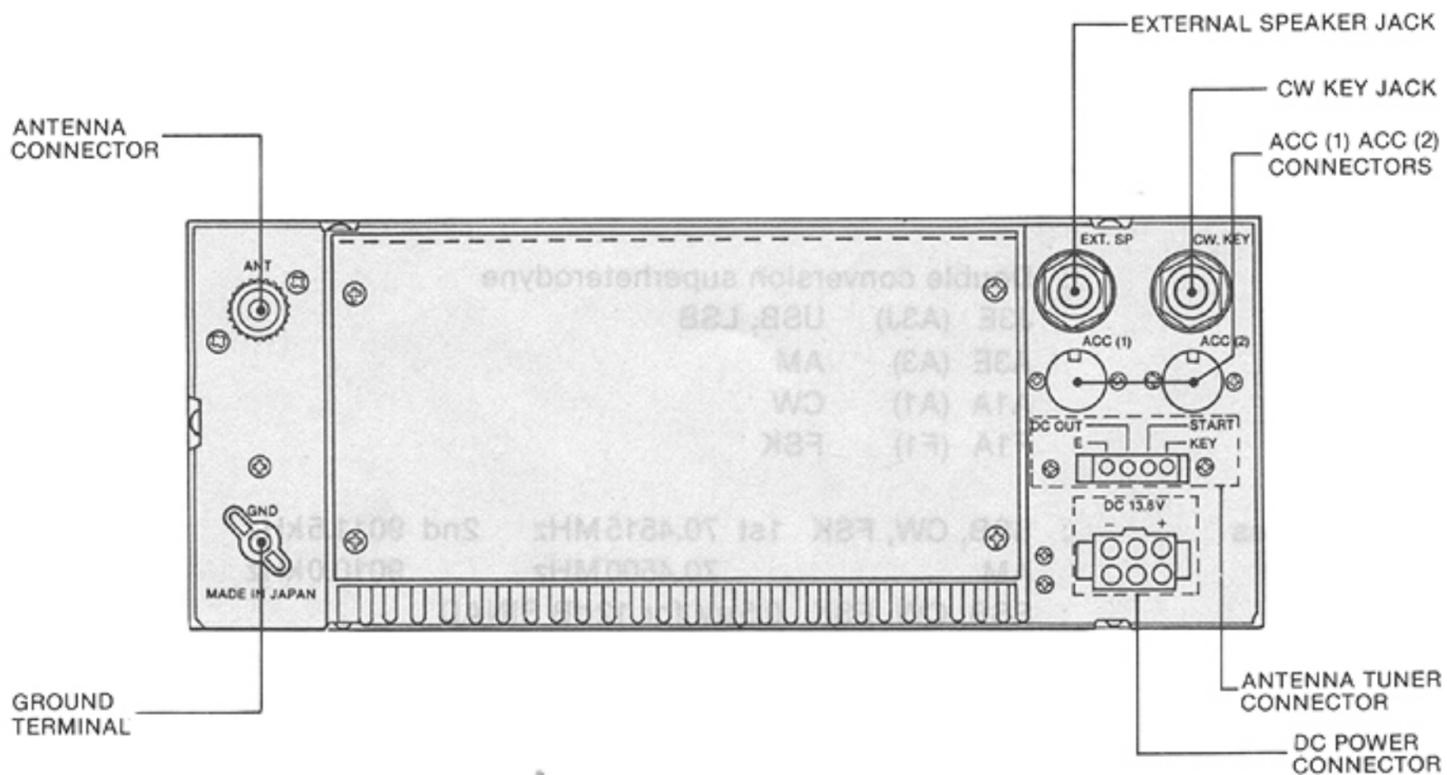

\*Bandwidth for 170Hz shift FSK operation. Internal switches available for 425Hz and 850Hz shift FSK operation.

SECTION 3 BLOCK DIAGRAM

**SECTION 4 CIRCUIT DESCRIPTION**

**4-1 RECEIVER CIRCUITS**

**4-1-1 RF CIRCUITS (RF UNIT)**

The received signal is passed from J606 through the 1.6MHz high-pass filter consisting of L666~L668 and C736~C741. After the strong broadcast signals are removed, the signal passes the filter which is designed for passing the desired frequency. This filter is switched by D606~D619 from among 6 bandpass filters and 1 low-pass filter.

These 7 filters are designed for the following bands:

BAND	FILTER
1.6MHz~3.0MHz	B1
3MHz~ 5MHz	B2
5MHz~ 7MHz	B3
7MHz~ 10MHz	B4
10MHz~ 14MHz	B5
14MHz~ 18MHz	B6
18MHz~ 24MHz	B7

Then the interference of image frequency is removed and the 1st and 2nd local oscillator frequencies leaking to the ANT terminal are suppressed by the low-pass filter consisting of L620, L621, C638~C641, and C743. The signal is then fed to the 1st mixer.

The 1st mixer, featuring low noise and high dynamic range, consists of JFETs Q607 and Q608, and converts the receiving signal into the 1st IF signal of 70.4515MHz. The 1st local oscillator frequency (70.4515MHz higher than the receiving frequency) from the PLL unit passes the high-pass filter, is amplified by Q609, has its harmonics removed by the low-pass filter, and is applied to the gates of Q607 and Q608.

The signal, converted to 70.4515MHz, passes mechanical crystal filter FI601-B, is amplified by Q606, passes a receive/transmit switching diode D604 and a

mechanical crystal filter FI601-A, and is fed to the 2nd mixer.

The total passband of both FI601-A and FI601-B is  $70.4515\text{MHz} \pm 7.5\text{kHz} / -3\text{dB}$ . The AGC voltage is applied to the 2nd gate of Q606.

The 2nd mixer is a diode DBM (double balanced mixer), IC604 and is injected with the 2nd local oscillator frequency of 61.44MHz from the PLL UNIT. The 70.4515MHz IF signal is converted to the 2nd IF signal (9.0115MHz) and is fed to the MAIN UNIT.

**4-1-2 9.0115MHz IF CIRCUIT (MAIN UNIT)**

The signal, converted to 9.0115MHz by the 2nd mixer in the RF UNIT, is amplified by Q1010 after the mixer's spurious components are removed by the double tuned circuit of L1005 and L1006.

FI1001 (SSB), FI1002 (CW, FSK), and FI1003 (AM) are crystal filters and their passbands are  $2.3\text{kHz} / -6\text{dB}$ ,  $500\text{Hz} / -6\text{dB}$  and  $6\text{kHz} / -6\text{dB}$ , respectively. Q1013 ~Q1015 switch among these three filters so that FI1001 (SSB) is selected when the mode switch is set to J3E (A3J), FI1002 (CW, FSK) is selected when the mode is A1A (A1) and FI1003 (AM) is selected when the mode is H3E (A3H).

Switching of filters during mode selection is carried out by Q1013~Q1015. During FSK reception, the filters must be switched according to the shift width of the reception signal.

Switching of the filters is carried out by changing the position of jumper (J1015). FI1002 (CW, FSK) must be selected when the shift width of the FSK reception signal is 170Hz, and FI1001 (SSB) must be selected when the shift width of the FSK reception signal is 425Hz or 850Hz.

The 2nd IF signal, amplified by Q1016 and Q1017, is fed to the detector and the AGC circuits.

**9.0115MHz IF CIRCUIT**

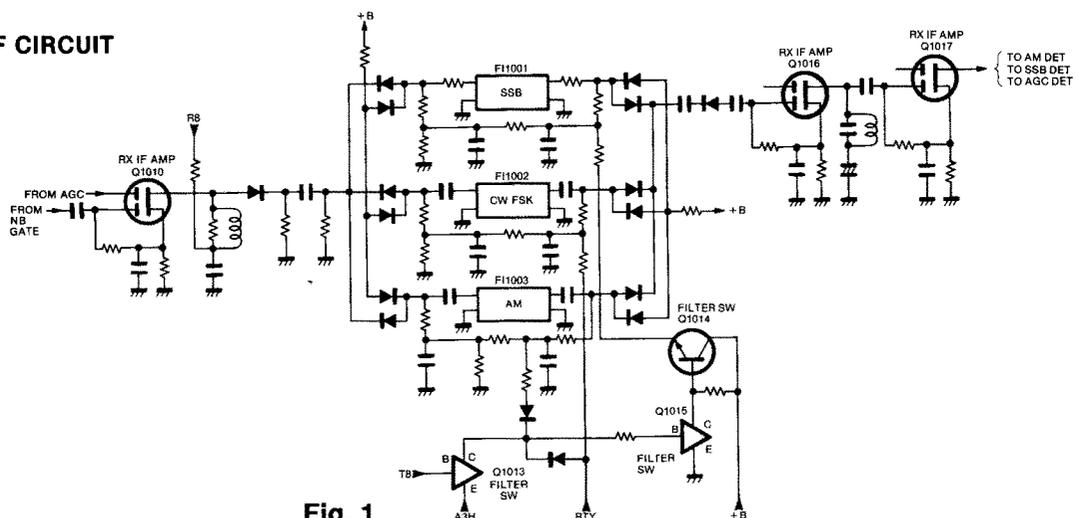

Fig. 1

**4-1-3 DETECTOR CIRCUIT AND AF PREAMPLIFIER**

The J3E (A3J), A1A (A1) and F1A (F1) signals are converted to AF signals at IC1007 and amplified at the AF amplifier Q1018.

The H3E (A3H) signals are converted to an AF signal at the diode detector D1005 and amplified at the AF amplifier Q1009.

These outputs are fed to the audio controlled squelch circuit. During transmission the local oscillation signal applied to IC1007 from BFO is stopped by turning D1037 OFF. Also, during H3E (A3H) reception output of the signal from IC1007 is stopped by stopping the BFO oscillation.

**4-1-4 NOISE BLANKER CIRCUIT (MAIN UNIT)**

A portion of the 2nd IF signal (9.0115MHz) from L1005 and L1006 is fed to the noise amplifier, Q1001~Q1003. This signal is amplified by approximately 80dB at Q1001, Q1002 and Q1003 and then rectified by D1001 and D1002. Q1004 is the AGC amplifier for the noise amplifiers and adjusts the gain of the noise amplifiers approximately 50dB.

The gate control circuit consists of Q1005~Q1006. This circuit turns the balanced noise gate consisting of D1011~D1014 ON and OFF by the voltage obtained from D1001 and D1002.

**4-1-5 AGC CIRCUIT (MAIN UNIT)**

The reception signal amplified at Q1017 is rectified at D1004 and is then amplified at Q1008. When signals are not being received, the output voltage (AGC voltage) of Q1008 is set to approximately 4V by R1021 and R1022. During reception of signals, the output voltage (AGC voltage) of Q1008 drops.

The AGC time constant is set to the fast attack/slow release by R1027, R1026, C1019, and C1018.

When transmission is selected from reception, the AGC voltage output from Q1008 during reception is held by Q1007. This prevents AGC voltage fluctuation each time reception is selected when receive/transmit switching is carried out during a short time (for example, during full break-in operation).

**4-1-6 BFO CIRCUIT (MAIN UNIT)**

The 9MHz local oscillator signal output from IC1011 (BFO mixer) is generated by mixing the signal obtained by dividing the 30.72MHz output of the PLL UNIT reference oscillator circuit (X1) into 1/3 and the 1.2MHz signal obtained by dividing the 4.9MHz output of the BFO circuit into 1/4.

The BFO circuit consists of X1001~X1005 and Q1025, and uses the necessary crystals in X1001~X1005 to oscillate frequencies in accordance with the various modes, reception and transmission.

The BFO circuit output is divided by 4 at IC1009 and becomes a 1.2MHz signal. This 1.2MHz signal and the 10.24MHz signal from the PLL UNIT are mixed at IC1011 to become the 9MHz local oscillation signal which is fed to IC1007 (SSB detector), IC1008 (balanced modulator) and Q1034 (carrier amplifier).

Varicaps (D1051, D1053, D1055, D1057 and D1060) are connected respectively in series to X1001~X1005. The DC voltage applied across these varicaps can be adjusted by the CLARITY CONTROL (R342) on the FRONT PANEL. This enables clarifier operation during reception.

For H3E (A3H) reception, the dividing operation of IC1009 is stopped to prevent beat reception.

A low-pass filter and double tuned circuit is connected to IC1011 (pin 3) to remove spurious signals from the output signal of IC1011.

**4-1-7 SQUELCH AND RECEIVE INDICATOR CIRCUITS (MAIN UNIT)**

For A1A (A1) and F1A (F1) reception, the signal that has been detected and amplified is amplified at IC1001<sup>1/2</sup>, is further amplified at buffer amplifier (Q1019) and detected at IC1005<sup>1/2</sup>. A time constant is obtained at C1101 for holding the voltage detected at IC1005<sup>1/2</sup>. This detected voltage is then input to IC1004.

For J3E (A3J) and H3E (A3H) reception, the signal that has been detected and amplified is further amplified, oscillated and limited at IC1001<sup>1/2</sup>, and triggers the one shot multi vibrator comprising IC1002. The mean voltage of the output pulse signal of IC1002 is proportional to the number of pulses per unit time. (In other words, IC1002 operates as an F-V converter.)

The output signal from IC1002 passes through the low-pass filter (IC1003<sup>1/2</sup>) which filters frequencies approximately 3.5Hz and below, is further inverse amplified (gain set at 0dB) at IC1003<sup>1/2</sup>, full-wave rectified at D1006 and D1007, and input to the comparator (IC1004). The output voltage of comparator (IC1004) is charged to C1101 and held.

The output signal of IC1005 is applied to the base of Q1020, and the output from the collector of Q1020 controls the squelch gate (IC1010). At the same time, illumination of the RECEIVE INDICATOR (DS307) is controlled by the output from the collector of Q1020.

**4-1-8 AF POWER AMPLIFIER (MAIN UNIT)**

After passing through the squelch gate (IC1010), the AF signal is amplified at Q1056, passed through the VOLUME CONTROL (R341) on the FRONT PANEL and applies to the AF power amplifier (IC1023). IC1023 is an audio power amplifier from which an output of 5W or more can be obtained. IC1023 has a low impedance output and has sufficient drive even if a 4Ω speaker is externally connected in parallel with the built-in 4Ω speaker.

**4-2 TRANSMITTER CIRCUITS**

**4-2-1 9.0115MHz IF CIRCUIT AND BALANCED MODULATOR (MAIN UNIT)**

During H3E (A3H) and J3E (A3J) transmission, the AF signal from the microphone amplifier (Q1023) is modulated at the DBM (IC1008), passed through FI1001 (SSB) filter and becomes the J3E (A3J) signal.

During H3E (A3H) transmission, the output signal from BFO mixer (IC1011) is amplified at carrier amplifier (Q1034), passed through FI1001 (SSB) filter added to the signal amplified at Q1012 as the carrier signal to

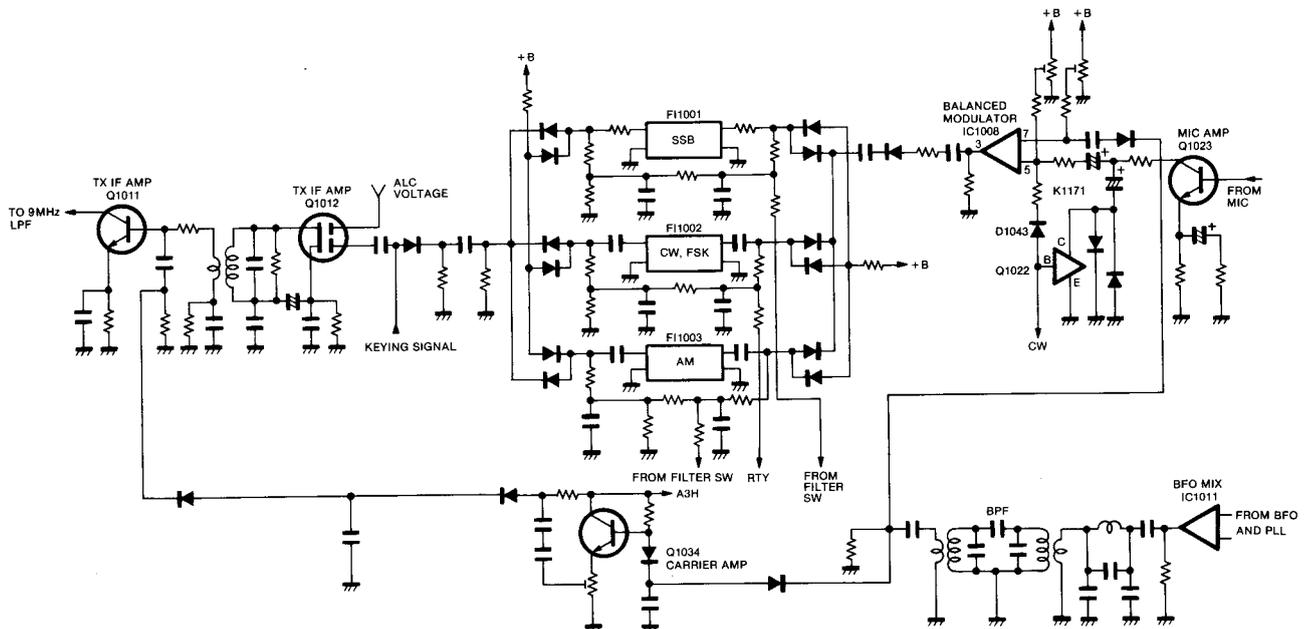

become the H3E (A3H) signal.

When the CW mode and the automatic tuning function are in operation, the "High" level signal is applied to the base of Q1022 to turn Q1022 ON. At the same time it mutes the signal from the microphone amplifier (Q1023), DC voltage is applied via D1043 and R1171 to IC1008 (pin 5) to change the DC balance between the input terminals of IC1008. By changing the DC balance between the input terminals of IC1008, the output signal of the BFO mixer (IC1011) is applied to IC1008 (pin 7) via D1047.

During A1A (A1) and F1A (F1) transmission, the signal passes through FI1002 (CW and FSK) filter. (However, this is applicable to F1A (F1) when the frequency shift width is set to 170Hz.)

After passing through filters FI1001~1003, the signal is amplified at Q1012 and Q1011, passed through P1001 and is sent to the RF UNIT. ALC voltage is applied to the 1st gate of Q1012, or the keying signal during the CW mode is applied to the 2nd gate from the keying circuit.

**9.0115MHz IF CIRCUIT AND BALANCED MODULATOR**

**Fig. 2**

**4-2-2 RF CIRCUITS (RF UNIT)**

The 9MHz transmitting output signal from the MAIN UNIT is mixed with the 61.44MHz local oscillator signal at L611~L612 and IC604, and converted to the 70.4515MHz IF signal. The spurious components are removed at the crystal filter FI601-A. The signal passes the transmit/receive switching diode D605 and attenuator R645~R647, then enters the transmitting mixer.

The attenuator acts as a matching network between

FI601-A and the mixer and improves the mixer's frequency characteristics.

The transmitting mixer of Q610 and Q611 is fed the local oscillator signal which goes into the 2nd gate. To improve the frequency characteristics, the output has a resistive load of approximately 500Ω so that the frequency characteristics are not affected at the output, and the signal is sent through the 25MHz low-pass filter of L629, L630 and C664~C668, then fed to Q612.

The FET amplifier Q612 has an input impedance of  $470\Omega$  to match the low-pass filter. The drain also has a resistive load. The 2nd gate of Q612 is applied with a control voltage for protection against overcurrents and high SWR, and to control output power.

The output of Q612 is amplified by Q613. To improve the frequency characteristics at Q613, the impedance between Q612 and Q613 is low so input capacitance can be ignored. Further, to compensate the frequency characteristics at the output, C673 is added to the emitter.

The output of Q613, after passing the 1.6MHz high-pass filter, passes through the attenuator of R670~R672 and is output to the PA UNIT. The attenuator acts as a buffer to the PA UNIT. This output is approximately +6dBm when the output is 150W.

To get stable operation, the transmitting circuits are supplied with T8V regulated power supply from the MAIN UNIT. The local oscillator frequency amplifier circuit also is supplied with an 8V regulated power supply from IC601.

#### 4-2-3 PA PROTECTION CIRCUIT (RF UNIT)

The voltage of the 2nd gate of Q612 is lowered and the gain is reduced for lower power to protect the final transistors from a temperature rise caused by increased collector loss of the final transistors and overcurrent due to high SWR. This is accomplished by the circuit of IC603, Q605, and Q614.

IC603B is a differential amplifier and amplifies the potential difference generated at R871 (located in the PA UNIT) due to the current flowing through the PA UNIT. Q614 buffers the reflected wave voltage from the SWR detector circuit in the FILTER UNIT. If either or both voltages exceed the voltage determined by R614 and R681, the inverted amplifier IC603A begins amplification. Normally, the output voltage of IC603B is determined by R614 and R681~R684. The voltage is lowered due to overcurrent or high SWR and the transmitting power is also lowered.

When the temperature rises, the voltage from J602 pin 4 (POL) turns Q605 ON. The output voltage from IC603B is divided by R620 and R621 to lower the voltage and the power is lowered.

Further, when the antenna tuner is connected, the key signal turns Q603 OFF and Q604 ON. The tuning power is set by the voltage divided by R620 and R619.

#### 4-2-4 PA UNIT

This unit consists of 4 boards (PA, ANT SW, DIN and JACK) and the rear panel chassis to which they are attached.

The PA board is a linear amplifier with an output of 150W and amplifies the transmitting signal from the RF UNIT. The ANT SW board performs antenna switching for transmit/receive and has a protection circuit to prevent damage to the receiving unit caused by a strong input during receive when the output of an adjacent transmitter is induced by the antenna. The connector board and rear panel chassis holds the various boards and the wiring for the connectors mounted on the rear panel chassis.

#### 4-2-5 PA CIRCUIT (RF UNIT) (See fig. 3)

The power amplifier is a 3-stage wide band linear amplifier and consists of a class A single amplifier for the input stage and class AB push-pull amplifiers for the driver and final stages. This unit produces an output of 150W PEP with an input of approximately +6dBm PEP. Further, each stage uses negative feedback and RC frequency compensation for a total gain variation of  $\pm 1.5\text{dB}$  or less (at an output of 55W).

#### 4-2-6 BIAS CIRCUIT (PA UNIT) (See fig. 3)

Although the input stage has a fixed bias due to the class A operation, the driver and final stages have adjustable biases due to their class AB operation.

The bias of the driver stage is adjusted by varying the current flowing through D801 with R827. Further, D801 and Q803 are thermally coupled to minimize the variations of the idling current due to temperature changes.

The final stage is provided with emitter follower Q806 since the current flow is greater than in the driver stage. The bias of the final stage is adjusted by varying with R823 the current flowing through D802 and D804. D804 compensates for the voltage drop between the base and emitter of Q806. D802 and Q804 are thermally coupled with Q806 for stability.

#### 4-2-7 THERMAL PROTECTION CIRCUIT (PA UNIT)

To prevent the final transistors (Q804, Q805) from excessive temperature rises and damage due to continuous transmitting, thermal switches S801 and S802 are thermally coupled to Q804 and Q805, respectively. When the temperature rises, the fan motor provided for the heat sink is turned on for forced air cooling. The fan motor rotates at intermediate speed during transmission.

S801 is a 80°C thermal switch and turns on the fan for high speed when Q804 reaches approximately 80°C. S802 is a 110°C thermal switch and turns on when Q804 reaches approximately 110°C. Then the HTP voltage is supplied to the RF UNIT to lower the transmitting output to approximately 60W.

Even when reception is selected from transmission, the fan motor continues rotating at low speed if the temperature of Q804 is at 80°C or more, namely when S801 is ON.

**4-2-8 ANTENNA SWITCHING CIRCUIT (ANTENNA SWITCH UNIT)**

D921 and RL922 carry out antenna switching for transmission and receive.

During transmission, the transmission signal supplied from the FILTER UNIT is input from P922 by turning ON of D921, passed through D921 and input to the antenna connector (J922).

During reception, the reception signal input from the antenna connector (J922) is passed through RL922, C924, RL921 and low-pass filter by turning ON of RL922, and input to the J606 of the RF UNIT from P921.

A low-pass filter with a cut-off frequency of approximately 30Hz consisting of L921, L922, C921 and C922 operates to prevent incidental radiation from the antenna during reception.

The antenna connector (J922) is provided with a surge absorber to prevent damage to the transmitting and receiving circuits caused by high voltages such as from lightning induction.

If a reception signal of 1W or more is input to the antenna connector (J922) during reception, the

resultant voltage generated at D923 is applied to Q921 to control Q923 and Q924. This controls RL921, the connection between the antenna and the RF UNIT is not maintained, and the receiving circuits are protected.

**4-2-9 FILTER CIRCUIT (FILTER UNIT)**

This unit is located between the PA UNIT and the antenna connector and suppresses the harmonics found in the transmitting output from the PA UNIT to -65dB or below.

Chebyshev low-pass filters are used and 7 filters having different cutoff frequencies are switched depending on the transmitting frequency.

Filter switching is performed by driving the relay with the signal from the LOGIC UNIT.

At the output is an SWR detection circuit which uses a toroidal core. The detected traveling wave voltage is sent to the MAIN UNIT to control the ALC and the reflected wave voltage is sent to the RF unit as a control voltage for the protection circuit used to prevent an overload on the PA stage caused by a mismatched antenna.

FILTER	FREQUENCY
L1	2~ 3MHz
L2	3~ 5MHz
L3	5~ 7MHz
L4	7~10MHz
L5	10~14MHz
L6	14~18MHz
L7	18~24MHz

**PA CIRCUIT AND BIAS CIRCUIT**

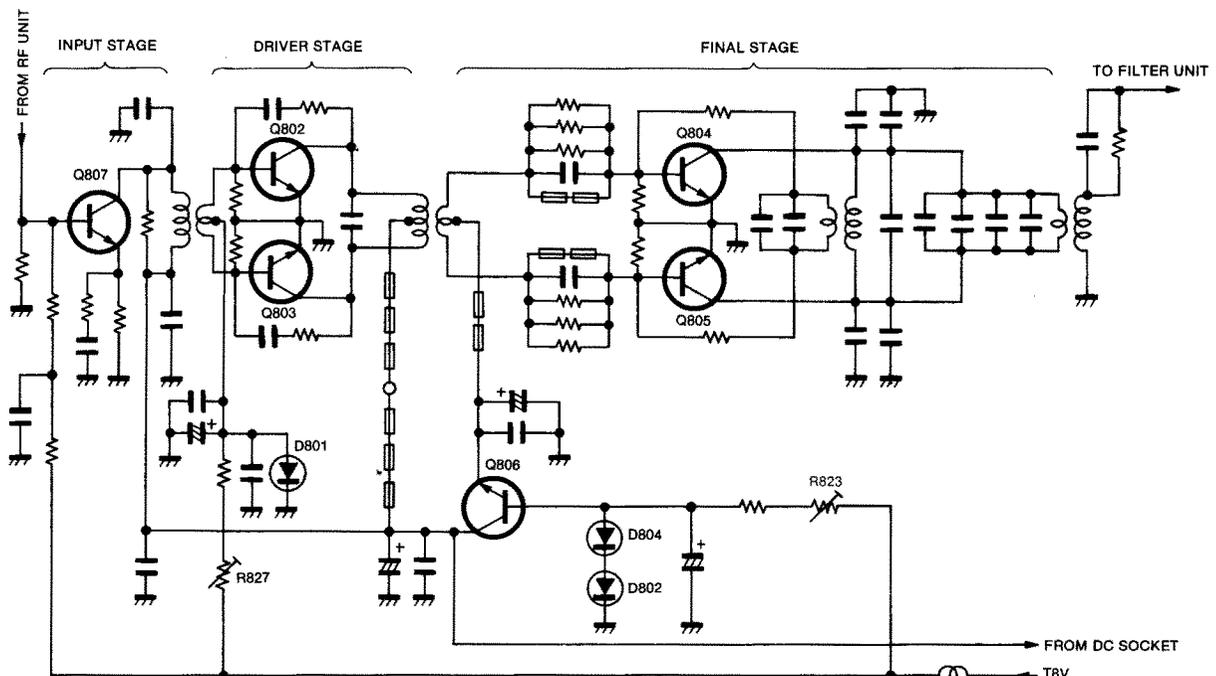

Fig. 3

#### 4-2-10 ALC CIRCUIT (MAIN UNIT)

A peak ALC circuit is provided so that the transmit peak level does not exceed the rated output. The traveling-wave voltage detected from the FILTER UNIT is amplified at operational amplifier IC1006 and compared with the reference voltage set by R1244 to

#### ALC CIRCUIT

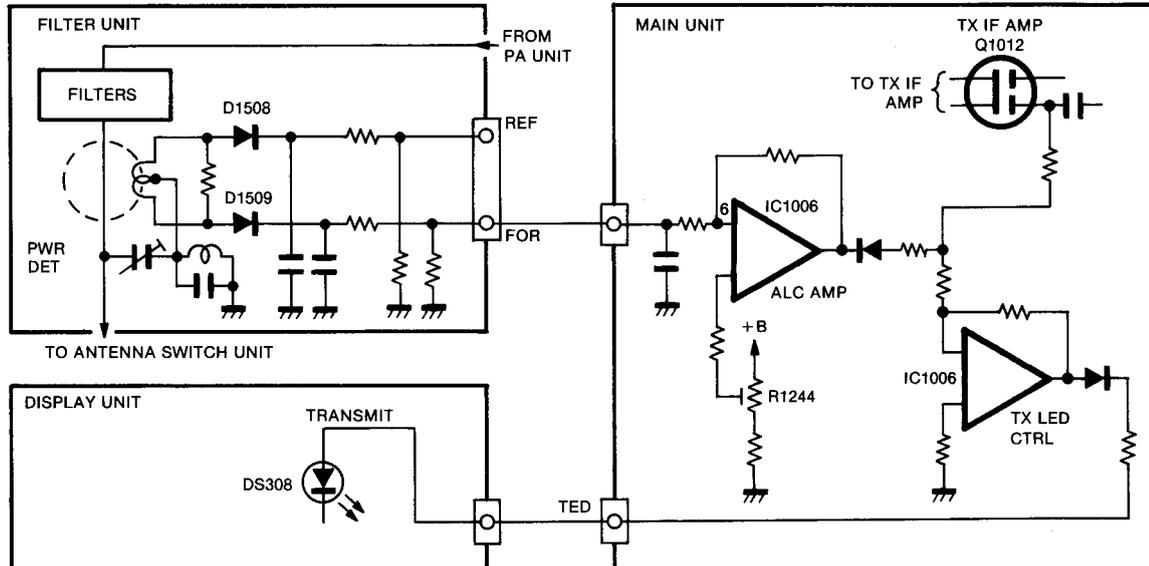

Fig. 4

#### 4-2-11 KEYING CIRCUIT (MAIN UNIT)

Keying control in the CW mode is carried out by IC1005. In other modes and when the CW KEY is turned down, an "High" level signal is output from IC1005 (pin 7), and this causes the voltage of the 2nd gate of Q1012 to become approximately 4V.

When the CW KEY has been turned up, the output voltage from IC1005 (pin 7) becomes a minus voltage, and Q1012 is turned OFF. Also, bias voltage of D1018 is controlled as the CW KEY is turned up or down which improves isolation. The leading edge of the bias voltage applied to D1018 is the first attack and its trailing edge is the slow delay so as not to effect the transmission signal waveform during CW KEY operation.

#### 4-2-12 POWER DOWN CIRCUIT (MAIN UNIT)

A power down circuit is provided to protect the circuits from overheating of the PA UNIT and to set the output signal power during tuning.

When the PA UNIT has overheated, the output signal power is lowered to 60W by lowering of the comparison voltage for setting the output signal power by R1245 and Q1029.

During tuning, the output signal power is lowered to 10W by lowering of the comparison voltage for setting the output signal power by R1247 and Q1031.

At the same time as the above operations are being executed, the RF UNIT gain is also controlled so that the ideal overall gain can be obtained.

generate the ALC voltage. This ALC voltage is applied to the 1st gate of Q1012 to control the output level of the transmit signal. The ALC voltage is also inverted and amplified by the same IC1006 to light up the TRANSMIT INDICATOR.

#### 4-3 OTHER CIRCUITS

##### 4-3-1 ALARM CIRCUIT (MAIN UNIT)

When the ALARM SWITCH (S323) on the FRONT PANEL is pushed ON, IC1022 removes chattering generated at the ALARM SWITCH and triggers IC1017.

IC1017 is a monostable multivibrator whose one shot time is set at approximately 50 seconds. This determines the alarm time (30~60 seconds). During alarm transmission (full alarm), a signal of 4Hz frequency is generated from IC1019. This signal is further divided at IC1018<sup>1/2</sup> to become a signal of 2Hz frequency which is used for determining the cycle of the alarm tone.

1300 Hz and 2200 Hz AF signals are switched over every 250 milliseconds and generated as the alarm signal.

##### 4-3-2 POWER SUPPLY CIRCUIT (+8V) (MAIN UNIT)

A constant voltage of approximately 8V is produced by IC1013.

During transmission, this voltage is supplied by Q1037 to the circuits for transmission that require 8V.

During reception, this voltage is supplied by Q1040 to the circuits for reception that require 8V.

A circuit comprising CMOS gates that switch with high reliability and in a short time are employed for selecting between the above reception and transmission states.

Also, the timing indication is output from all MAIN UNIT circuits (Q1036, IC1012) during switching over to circuits that require reception/transmission selection in each of the units.

**4-3-3 POWER SUPPLY CIRCUIT (-5V) (MAIN UNIT)**

Minus DC voltage of approximately -5V is obtained by double voltage rectifying at D1090 and D1091 the oscillation signal output from IC1015 (pin 6) and applying this to constant-voltage diode (D1089).

This minus DC voltage (-5V) is used at ALC, AGC and keying circuit.

**4-3-4 TONE GENERATOR CIRCUIT (MAIN UNIT)**

A 1kHz side tone for the CW mode, 1300Hz and 2200Hz emergency signal alarm tones and the TONE frequency

during the FSK mode are generated at IC1025.

IC1025 is an IC for TONE generation. By selecting any one of IC1025 pins 1~5, the dividing ratio of the oscillation frequencies of X1006 and X1007 can be varied, and transmission output of stable frequency can be obtained.

To obtain the transmission output of the required frequency from IC1025, the input program to IC1025 pins 1~5 is changed by the matrix circuit consisting of D1123~D1160.

Keying of the monitor tone in the CW mode and ON/OFF switching of the monitor tone in the FSK mode are carried out by Q1058.

**TONE GENERATOR CIRCUIT**

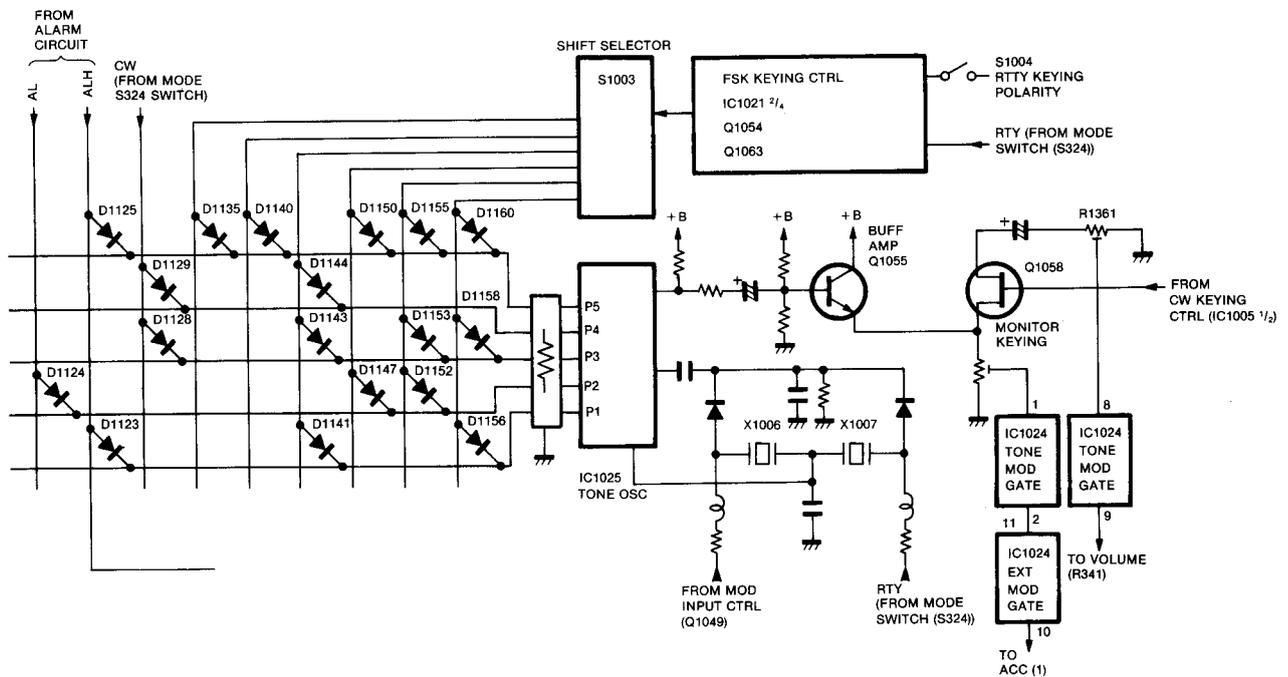

Fig. 5

**4-3-5 MIC CIRCUITS (MAIN UNIT)**

MAIN UNIT receives the signal from the MIC connector. MIC circuit is selectable according to the type of microphone and antenna tuner.

J1009 is a connector for the microphone. The use of each pin is as follows.

1. AF1 Connected to the built-in speaker. When the SPEAKER SWITCH is turned ON while shorting pins 1 and 7, the built-in speaker is used.
2. PTT PTT pin. Transmits when shorted with pin 3 and ground.
3. PTTE Ground pin for the PTT.
4. MIC MIC ground pin.
5. MICE MIC pin. When shipped from the factory, a DC voltage is applied but becomes input through a capacitor when W63 is cut.
6. NC No connection.
7. AF2 AF output from the MAIN UNIT.

**4-4 PLL CIRCUITS**

PLL UNIT generates 2 oscillating outputs (1st LO and 2nd LO signals) required by the RF UNIT and another oscillating output (3rd LO signal) used to produce the BFO frequency within the MAIN UNIT. Among these, the 1st LO is a frequency variable output in the 72~95MHz band and is generated by the PLL circuit having 2 locked loops. The 2nd and 3rd LO outputs are fixed and produced by multiplying or dividing the reference frequency signals.

The oscillating outputs produced within PLL UNIT are all determined by a single reference frequency. Adjusting this frequency corrects all the oscillating outputs.

**4-4-1 REFERENCE OSCILLATOR CIRCUIT (PLL UNIT)**

X1 is a reference oscillator circuit for oscillation of 30.72MHz frequency.

In X1, consisting of a temperature-compensating oven heater and crystal unit, an oscillation circuit and a power stabilizing circuit for protecting the oscillation circuit are contained in a single case which is of two-layer construction for thermal stability.

The output signal frequency of X1 used as the reference frequency is highly stable with a maximum error of  $\pm 0.1\text{ppm}$  in an ambient temperature of  $-30^{\circ}\text{C}\sim +60^{\circ}\text{C}$ .

**4-4-2 2nd LO CIRCUIT (PLL UNIT)**

The output of the reference oscillator circuit is doubled at Q14, has its spurious components removed by the band pass filter of L3~L5, and fed to the RF UNIT. The output is +3dBm with a 50Ω load at 61.44MHz.

**4-4-3 3rd LO CIRCUIT (PLL UNIT)**

The output of the reference oscillator circuit is divided by 3 at IC5 to obtain 10.24MHz. It is fed to the MAIN UNIT through emitter follower of Q203.

**4-4-4 1st LO CIRCUIT (PLL UNIT)**

The PLL circuit composed of 2 locked loops, a main loop and sub-loop are used. The sub-loop is used for the heterodyne signal within the main loop and the VCO output from the main loop is used for the 1st LO output.

The sub-loop causes VCO Q201 to oscillate at approximately 115~120MHz. This signal passes buffer amplifier Q202 and is locked by PLL ICs IC201 and IC202. The phase comparator frequency of this loop is 5kHz and varies the dividing ratio of the programmable divider within IC201. A frequency variation of 5MHz in 50kHz steps is obtained. The locked VCO

output passes through IC204 and IC203, is divided into 1/500 to a frequency of 230~240kHz. This is mixed by IC4 with the frequency of the reference oscillator circuit and is applied to IC3 within the main loop as a signal having a 10kHz variation in 100Hz steps within 30.95~30.96MHz.

The main loop switches 4 VCOs to oscillate at a frequency within 72.053MHz~94.4529MHz, required by the 1st LO. The lock is accomplished by the loop consisting of IC1, IC2, IC3, etc. The phase comparator frequency is 10kHz and varies the dividing ratio of the programmable divider within IC1 to vary the frequency in 10kHz steps. Further, mixer IC3 is provided within the loop. The signal obtained from the sub-loop having a frequency variable in 100Hz steps is used as a heterodyne signal. This covers the frequency variation in 100Hz steps required by the 1st LO.

The comparator frequency for both the main and sub loops is produced by dividing the frequency of the reference oscillator circuit.

**4-4-5 MUTE CIRCUIT (PLL CIRCUIT)**

When the lock of the main or sub loop becomes "unlocked" or when the frequency is varied, the outputs of the 1st and 2nd LO are blocked to prevent transmitting or receiving on a frequency other than the desired one. The unlock signal output from IC1 and IC201 is given a suitable time constant by Q8 and Q9 and applied to Q24 and Q13 to stop the operation of the amplifiers in the 1st and 2nd LO, respectively, so that there are no outputs.

**4-5 LOGIC CIRCUIT**

All control of the receive and transmit frequencies of this equipment is performed by IC505.

**CPU PORT ALLOCATIONS**

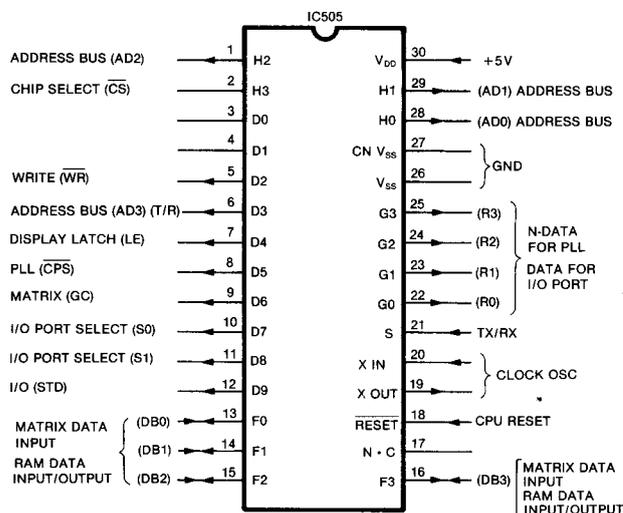

Fig. 6

**INPUT/OUTPUT CONTROL IC PORT ALLOCATIONS**

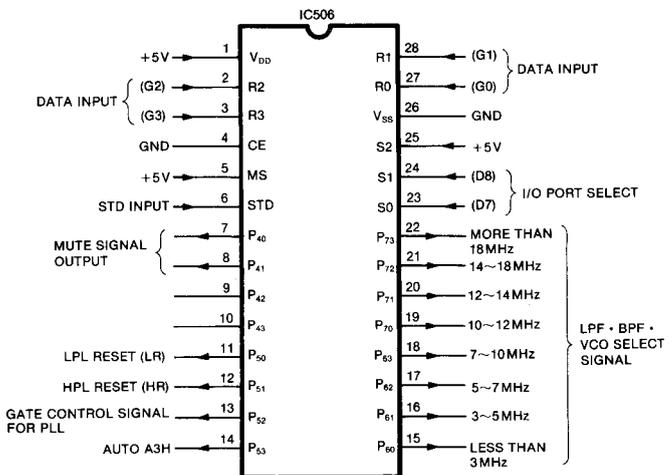

Fig. 7

When the power is turned on, the signal from IC508 (pin 12) resets IC505. The receiving and transmitting signal is fetched from the S input terminal and the frequency data stored in IC501 from the port F. (port H is for the control signal for IC501) Next, IC505 outputs, from port G, frequency data, PLL's N-data (PLL control data), and switching data for the band pass filter and low-pass filter.

As a result of the data from port G and control signals

D7~D9, IC506 outputs band switching data to P60~P73 (Table 1), PLL control signals to P50~P52, and mute signals for outside the marine bands to P40 and P41.

IC507 buffers the outputs for the data from port G of IC505 and the control signal from P52 of IC506. IC509 is the buffer for the low-pass filter switching relay. IC510 is the power supply (5V) for LOGIC and MATRIX UNITS.

Port P	Band	BPF	LPF	VCO	Transmit Enable Band
P60	1.6000~ 2.9999 MHz	B1	L1	V1	2.0000~ 2.9999 MHz
P61	3.0000~ 4.9999 MHz	B2	L2	V1	4.0000~ 4.9999 MHz
P62	5.0000~ 6.9999 MHz	B3	L3	V1	6.0000~ 6.9999 MHz
P63	7.0000~ 9.9999 MHz	B4	L4	V2	8.0000~ 8.9999 MHz
P70	10.0000~11.9999 MHz	B5	L5	V2	—————
P71	12.0000~13.9999 MHz	B5	L5	V3	12.0000~13.9999 MHz
P72	14.0000~17.9999 MHz	B6	L6	V3	16.0000~17.9999 MHz
P73	18.0000~23.9999 MHz	B7	L7	V4	22.0000~22.9999 MHz

Notes: The voltage supplied by the lithium backup battery installed in the RAM UNIT drops as the battery approaches its service life. This may cause the frequency data stored to the RAM (IC501) to be lost.

If the frequency data stored to the RAM (IC501) is lost, the transceiver can be used by inputting the desired frequency by the PROGRAMMING KEYBOARD on the FRONT PANEL. Further, the frequency data of 2182kHz will not be lost as it is written into the CPU memory.

Table 1

#### 4-6 CIRCUITS ON THE FRONT PANEL (DISPLAY AND MATRIX UNITS)

LEDs (DS301~DS306) for frequency indication are lit by the 7-segment LED drive signal supplied from IC303. The 7-segment LED drive signal is obtained by conversion of the data supplied from the LOGIC UNIT at IC303 (BCD to 7-segment latch/decoder/driver). R301~R308 are resistors for limiting the capacity of the current flowing to the LEDs when the LEDs (DS301~DS306) for frequency indication are lit.

IC302a and Q302 are provided for lighting the segments for decimal point display on DS302 and DS305. (Each of the decimal points are for indicating 1MHz and 100kHz bands.)

IC302b and Q301 are provided for lighting the LEDs for indicating the 10MHz decimal point when 2182kHz is selected using the CHANNEL GROUP and 2182kHz SWITCH. (This 10MHz decimal point display is for indicating that the transceiver has automatically switched over to the H3E mode when 2182kHz has been selected using the CHANNEL GROUP and 2182kHz SWITCHES.)

IC304 (BCD to decimal decoder) converts the BCD signal supplied from the LOGIC UNIT to a decimal signal and sends this to the matrix circuit in the DISPLAY UNIT and IC301 (LED driver). IC301 buffer amplifies the signal supplied from IC304 and outputs this to LEDs (DS301~DS306) for frequency indication as the signal for lighting each of the digits.

IC305 (tri-state buffer) is used as a gate for sending data supplied from the matrix circuit in the DISPLAY UNIT to the LOGIC UNIT. IC305 (tri-state buffer) closes the gate except when data from the matrix circuit is being sent to the CPU (IC505) in the LOGIC UNIT. This prevents collision of output data sent from the RAM UNIT and output data from the matrix circuit.

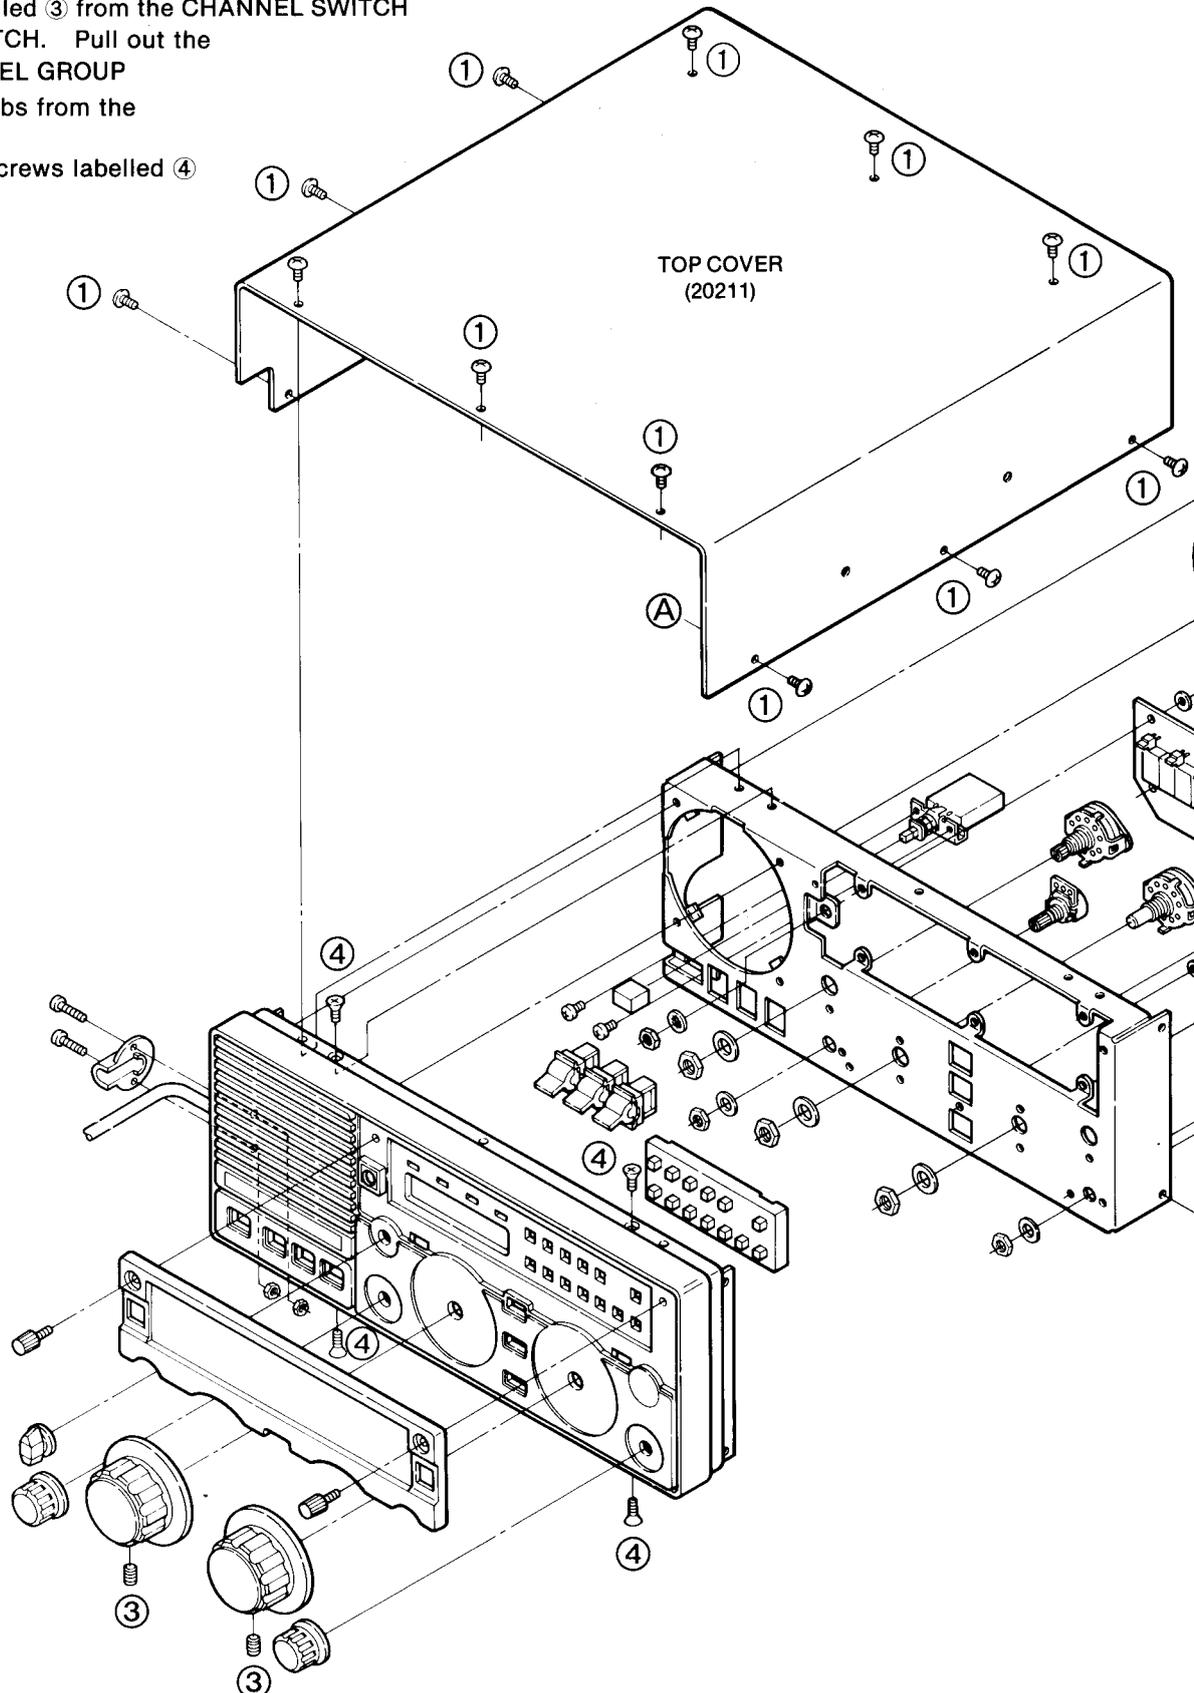

IC307 controls generation of the control signal for automatically setting the frequency to 2182kHz and the mode to the H3E mode when the transceiver has switched over to alarm operation. It is also controls generation of the control signal for cancelling these.

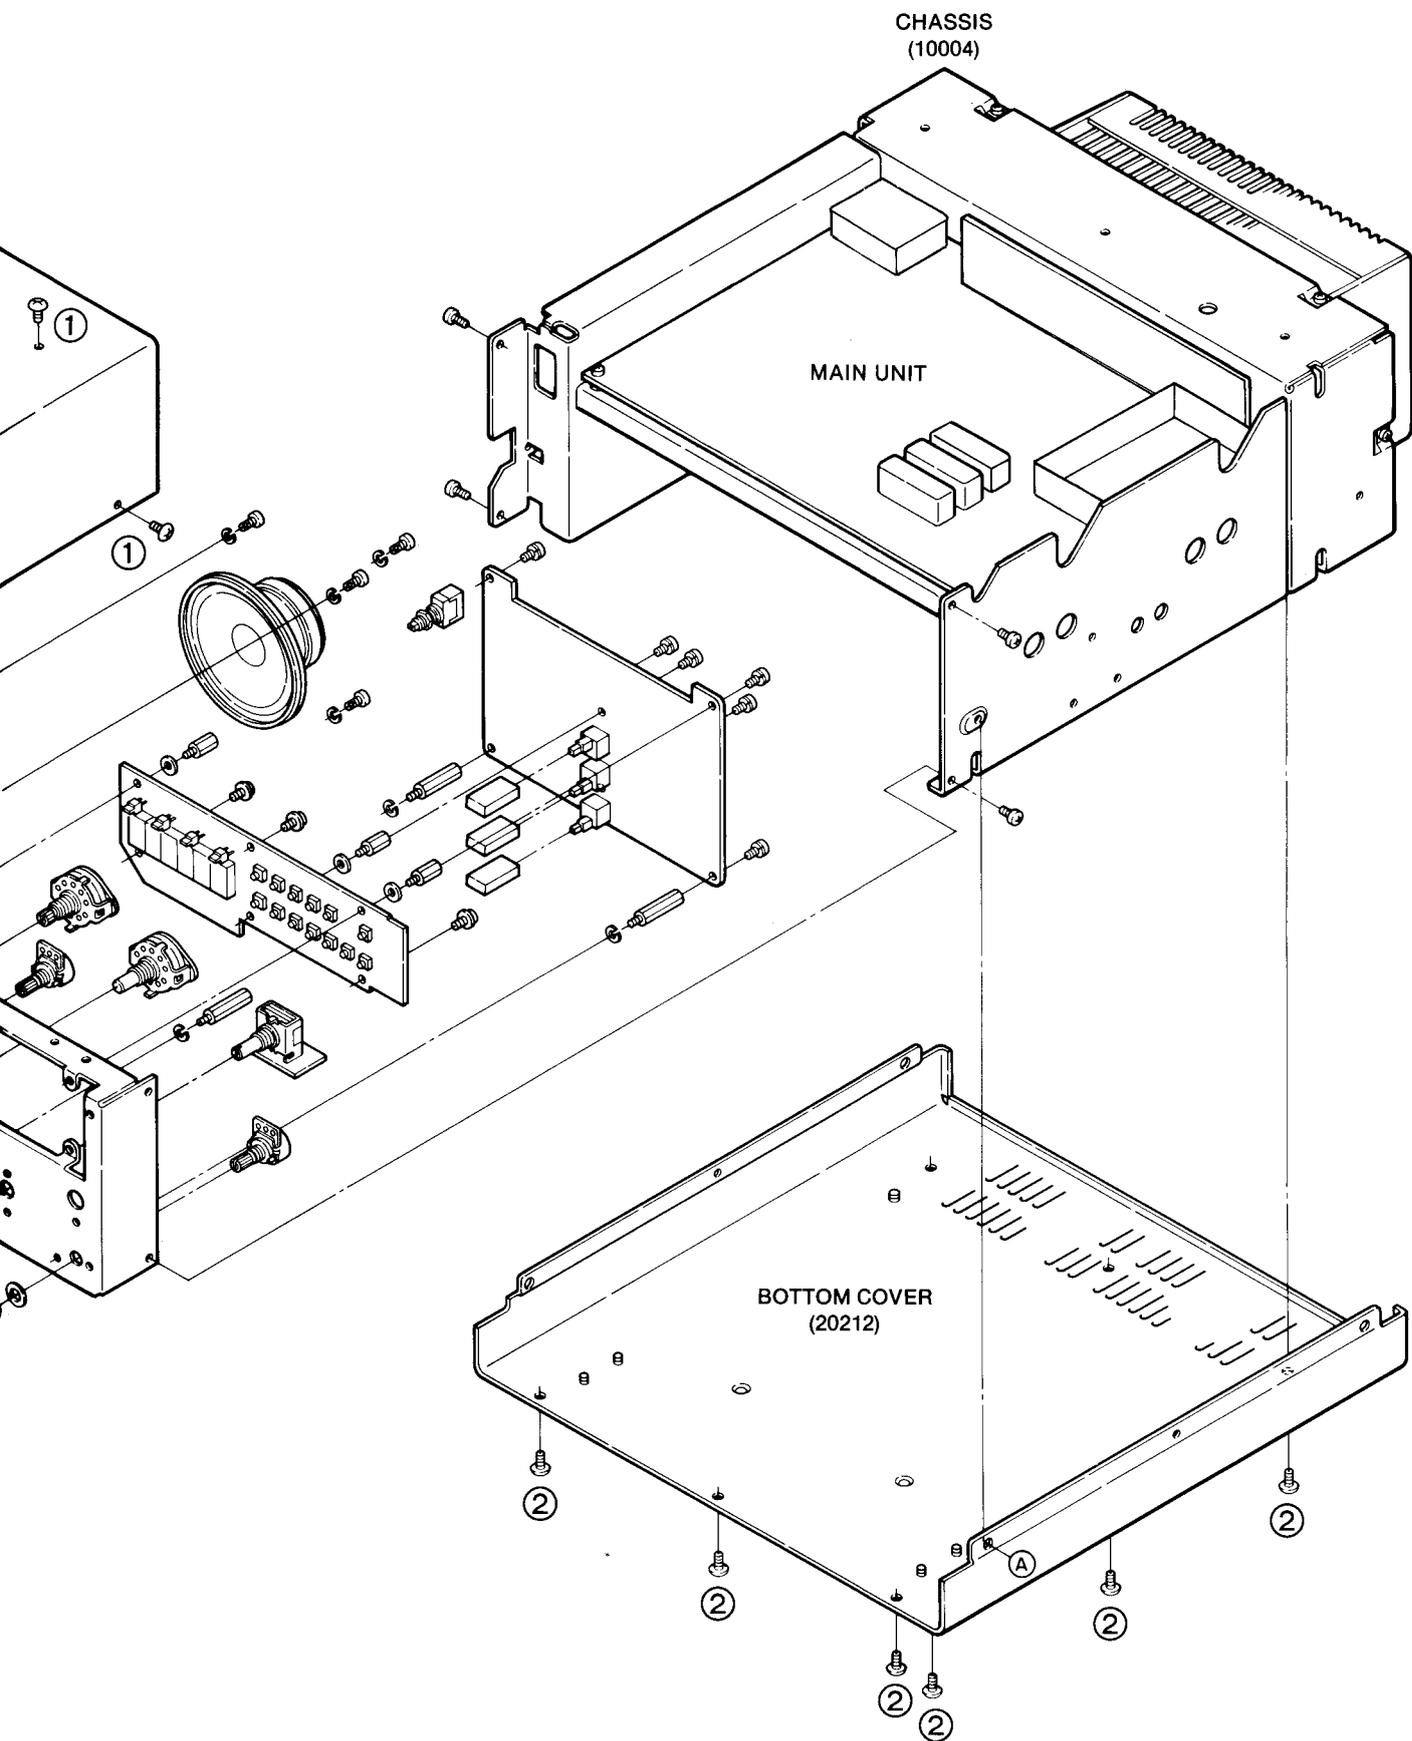

Q307~Q312 and Q304 buffer the signal for MODE SWITCH (S324) and outputs to MAIN UNIT. S328 is used to disable the key input and a key cannot be input in open state.

## SECTION 5 MECHANICAL PARTS AND DISASSEMBLY

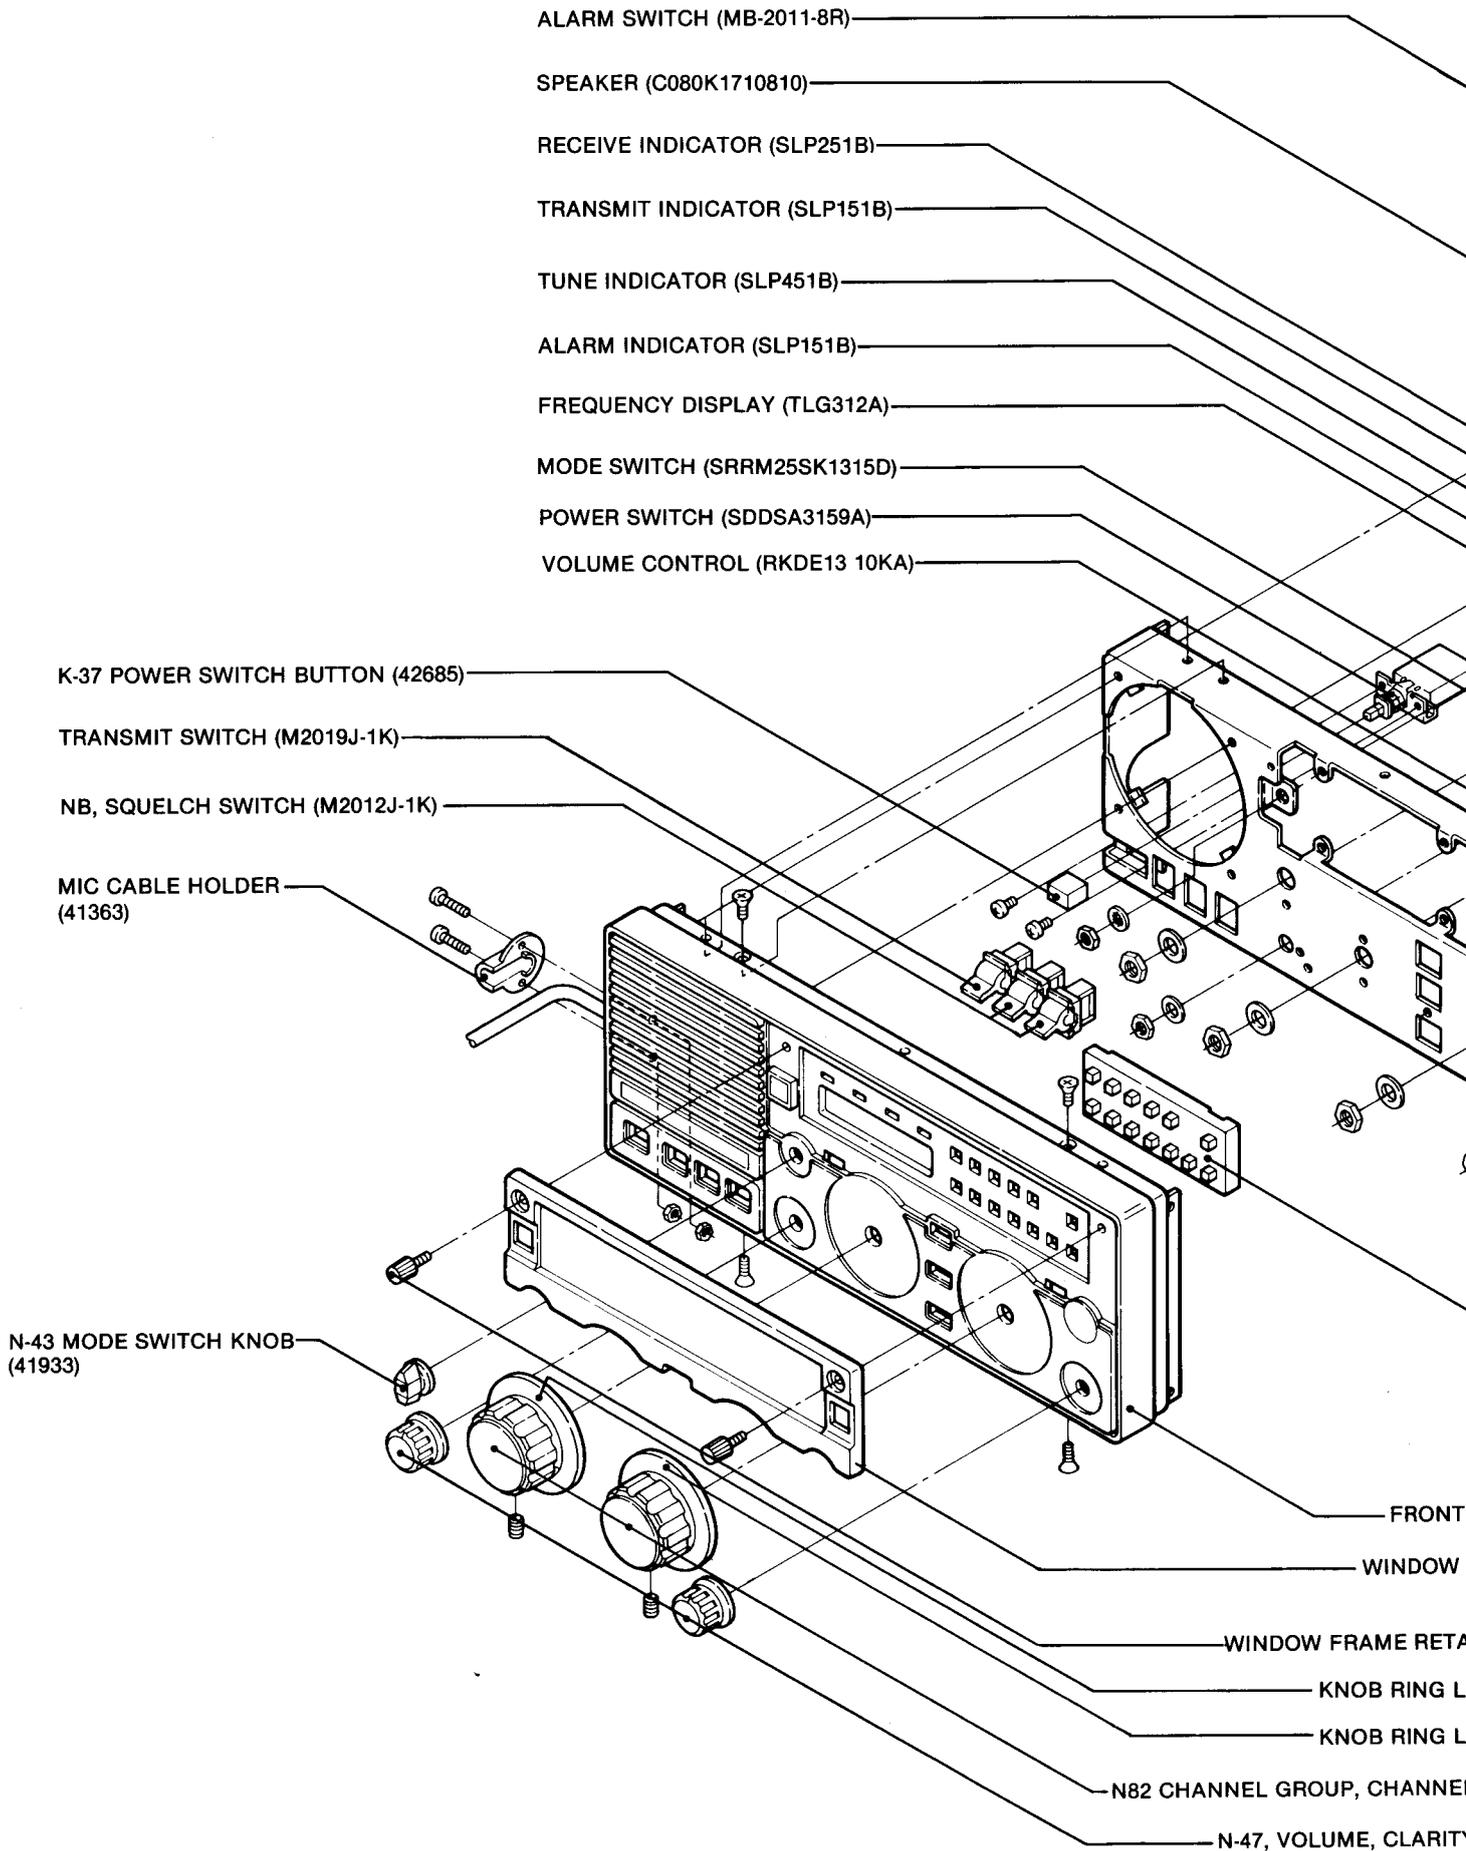

## 5-1 FRAME DISASSEMBLY

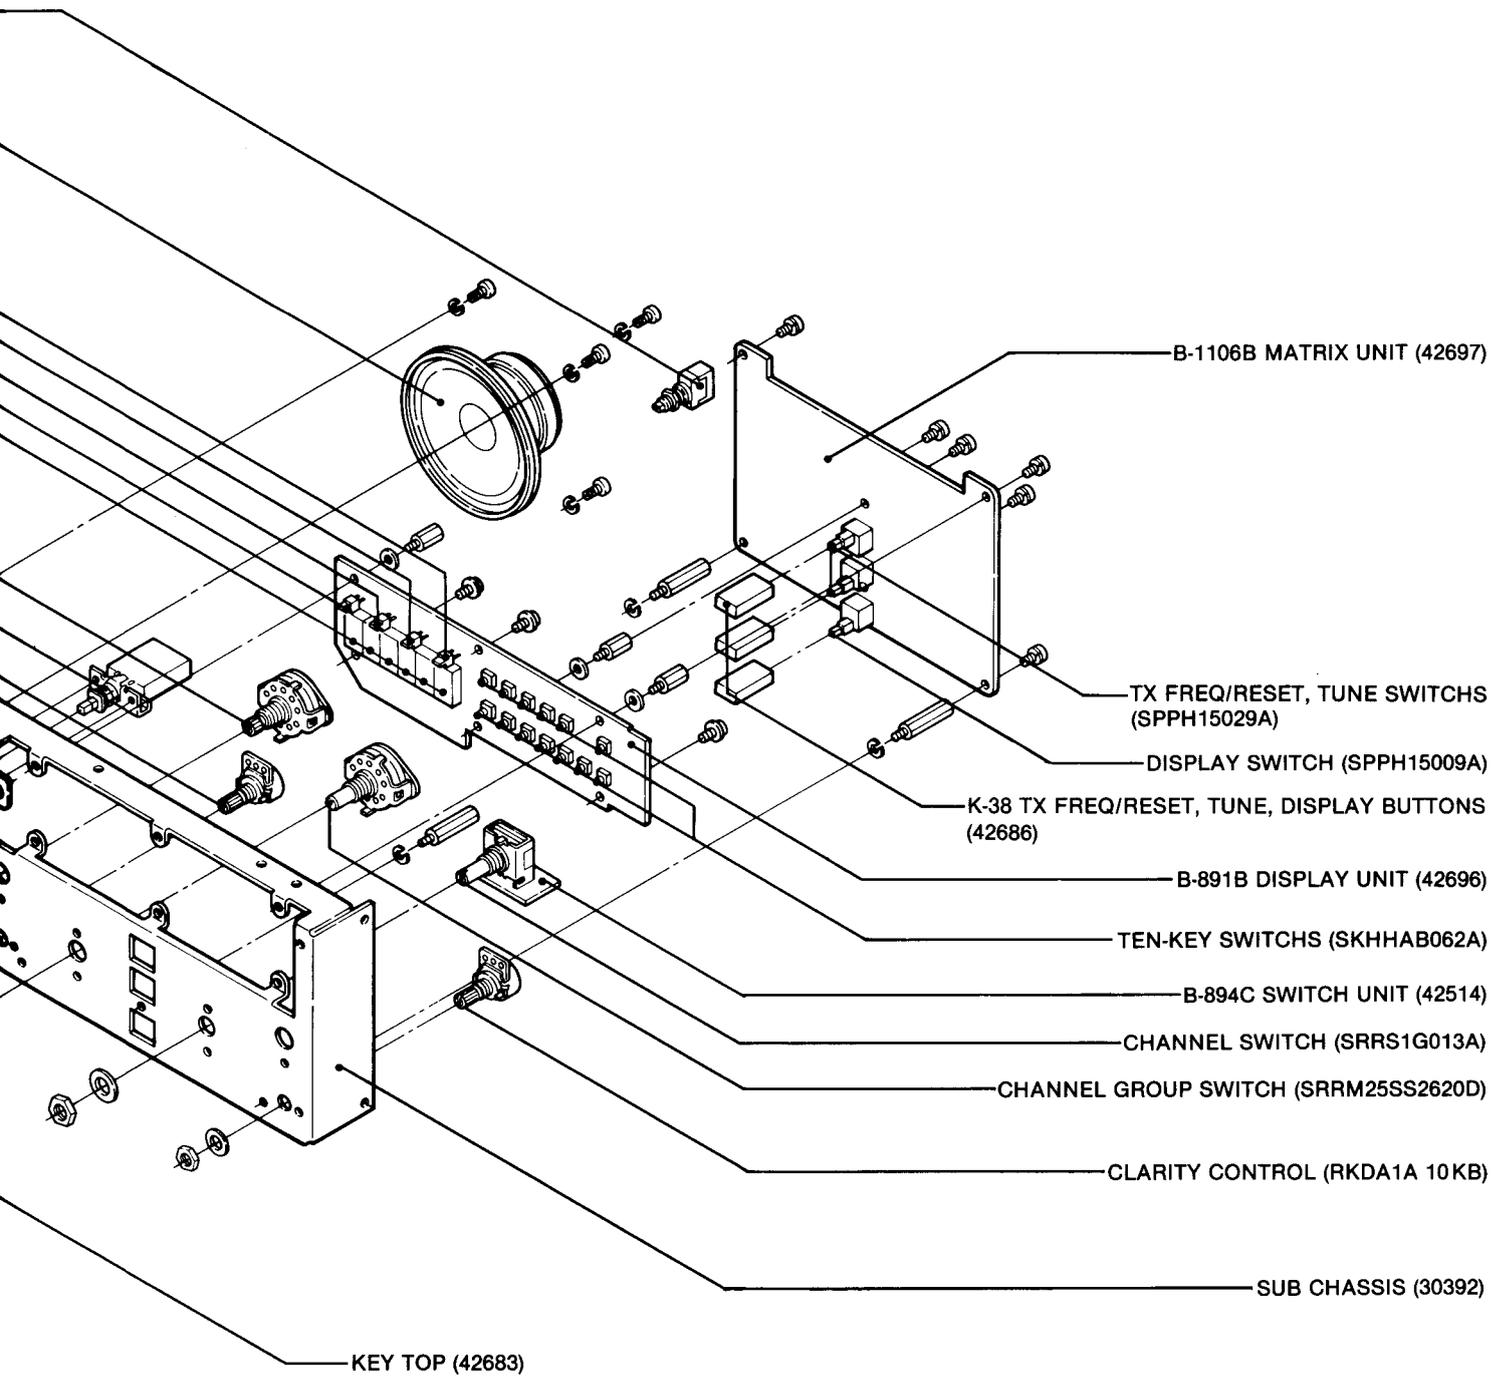

1. Unscrew and remove the 12 screws labelled ① from the top cover. Remove the top cover.
2. Unscrew and remove the 6 screws labelled ② from the bottom cover. Remove the bottom cover.
3. Remove the hex screws labelled ③ from the CHANNEL SWITCH and CHANNEL GROUP SWITCH. Pull out the CHANNEL SWITCH, CHANNEL GROUP SWITCH and the other 3 knobs from the front panel.
4. Unscrew and remove the 4 screws labelled ④ from the front panel. Remove the front panel.

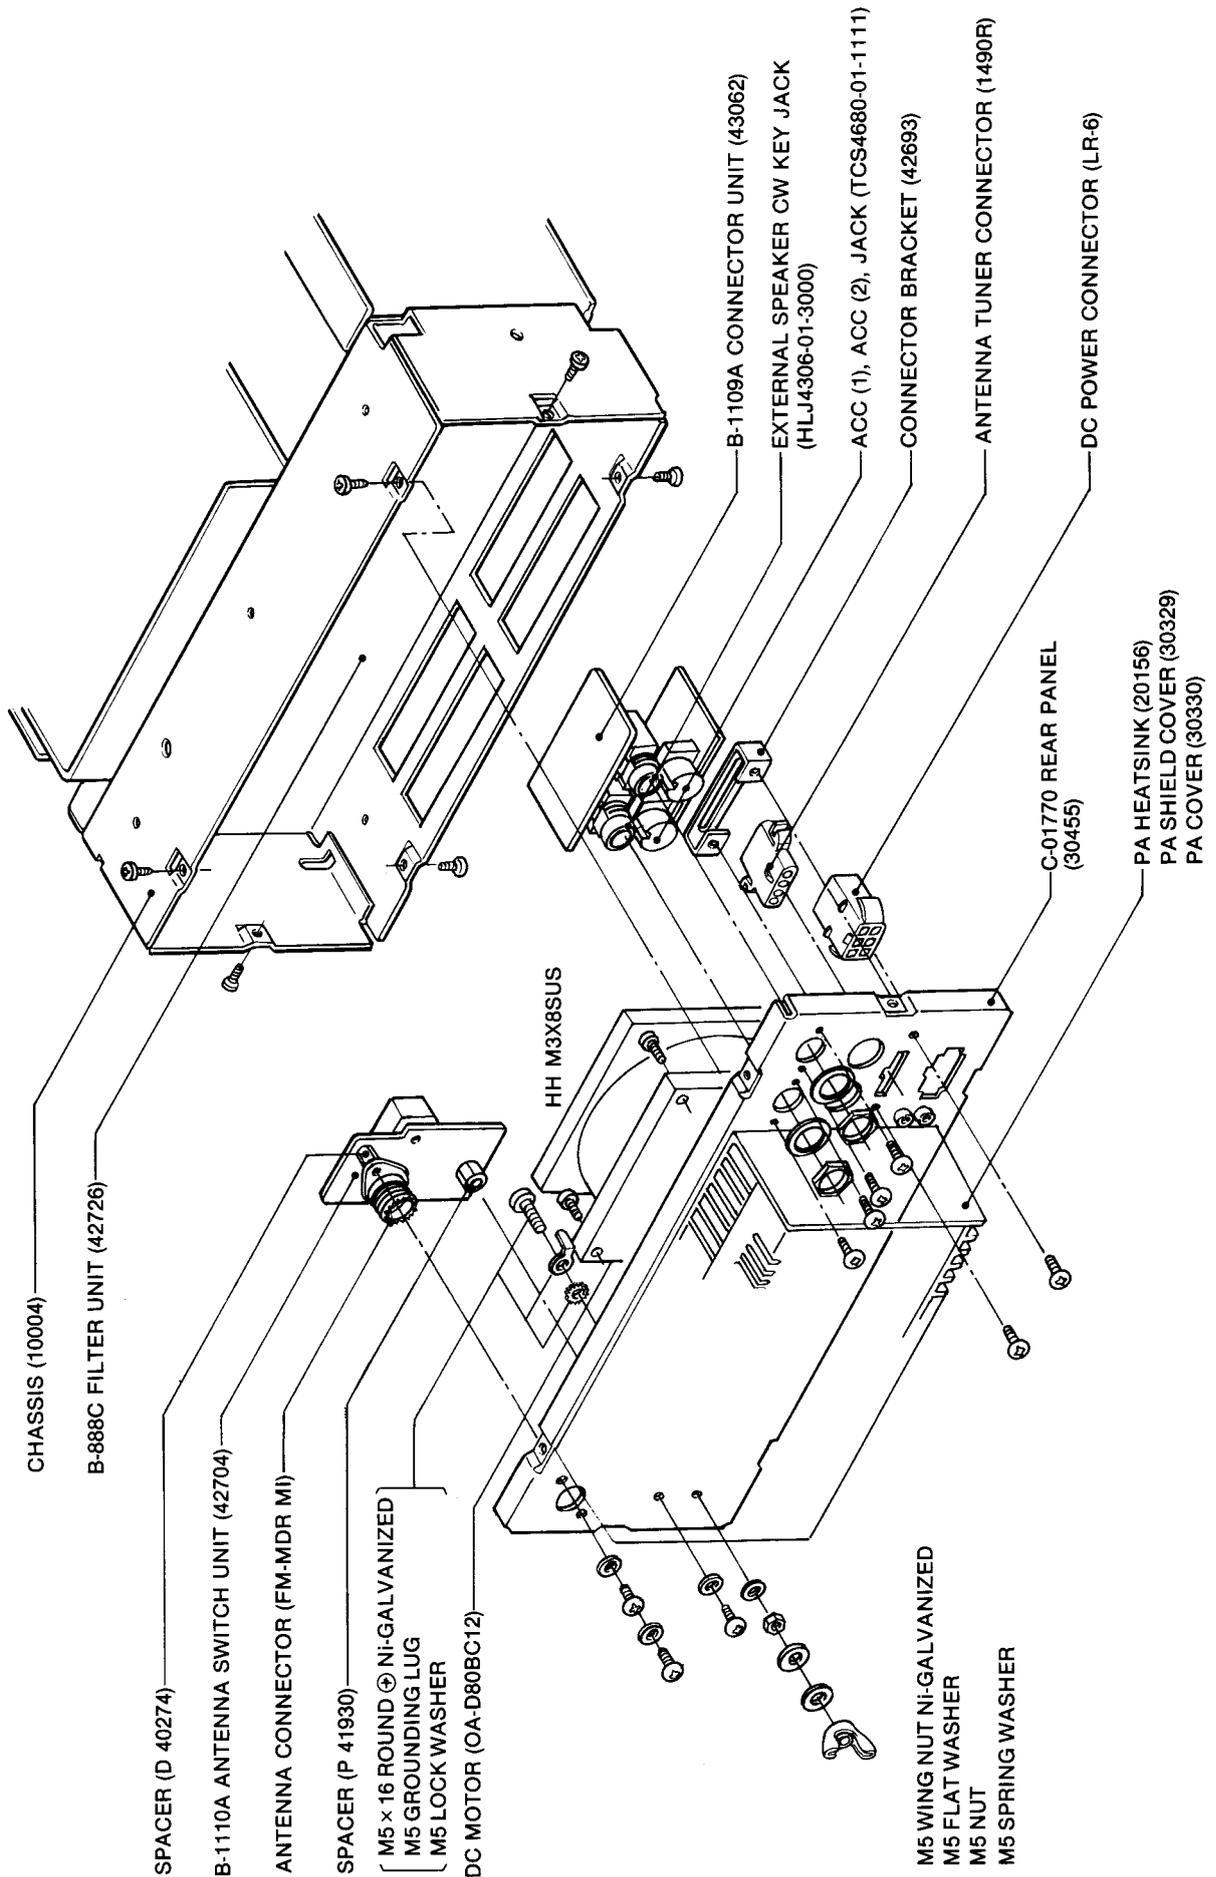

5-2 FRONT PANEL DISASSEMBLY

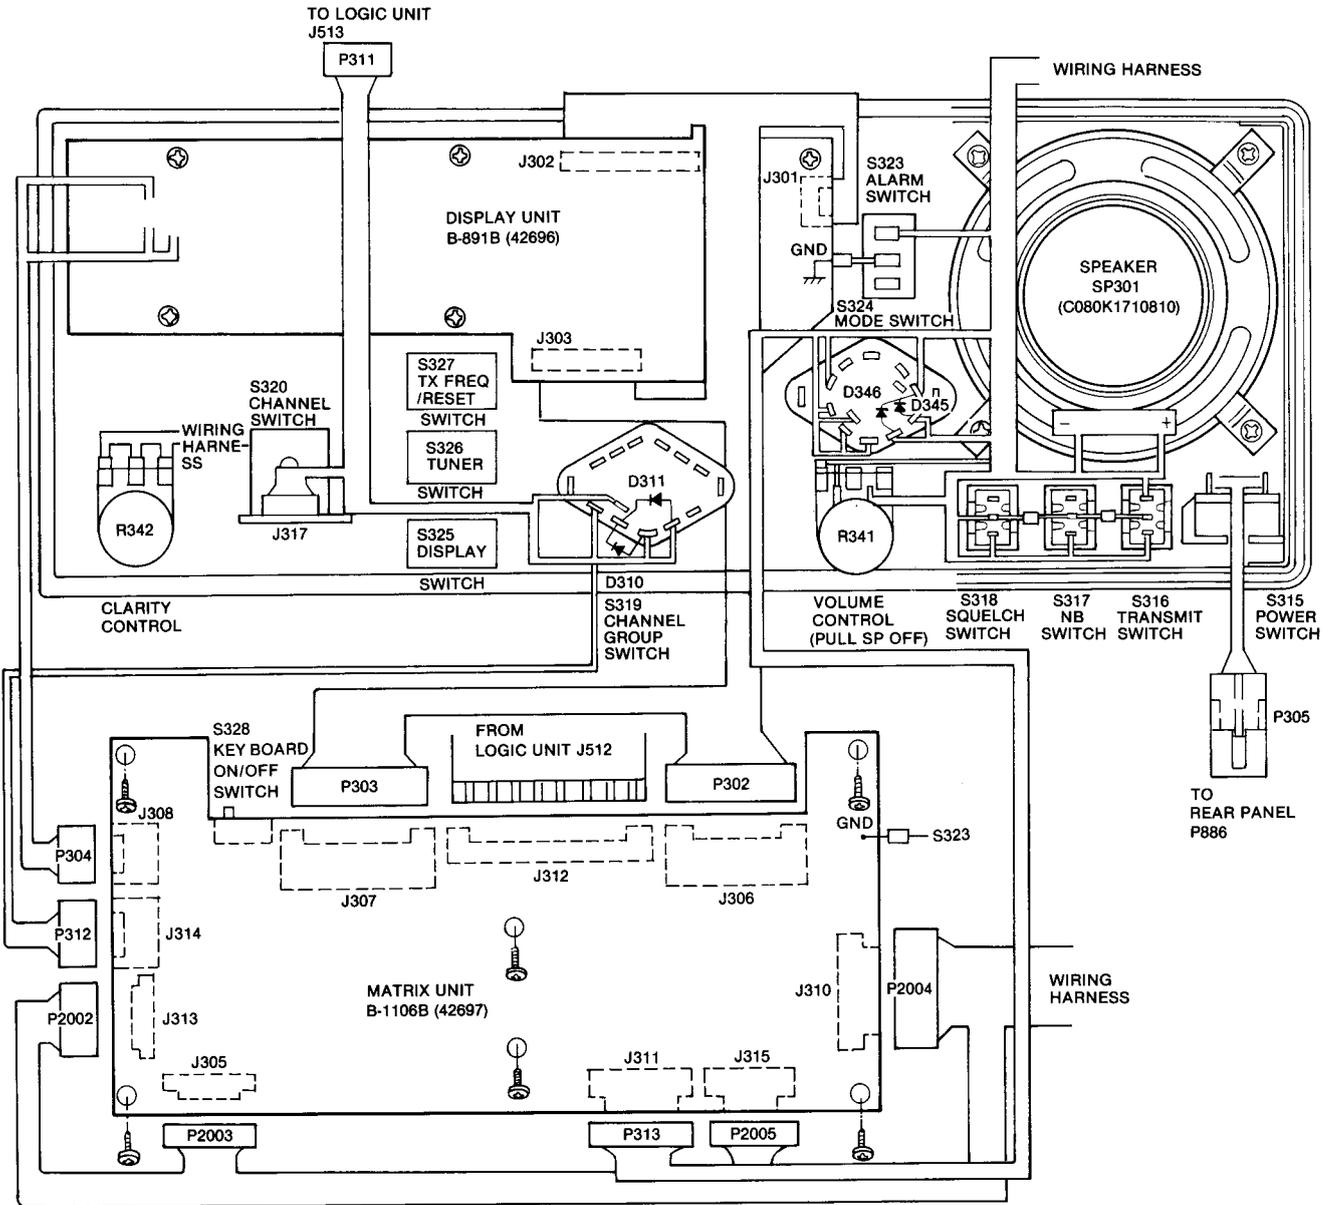

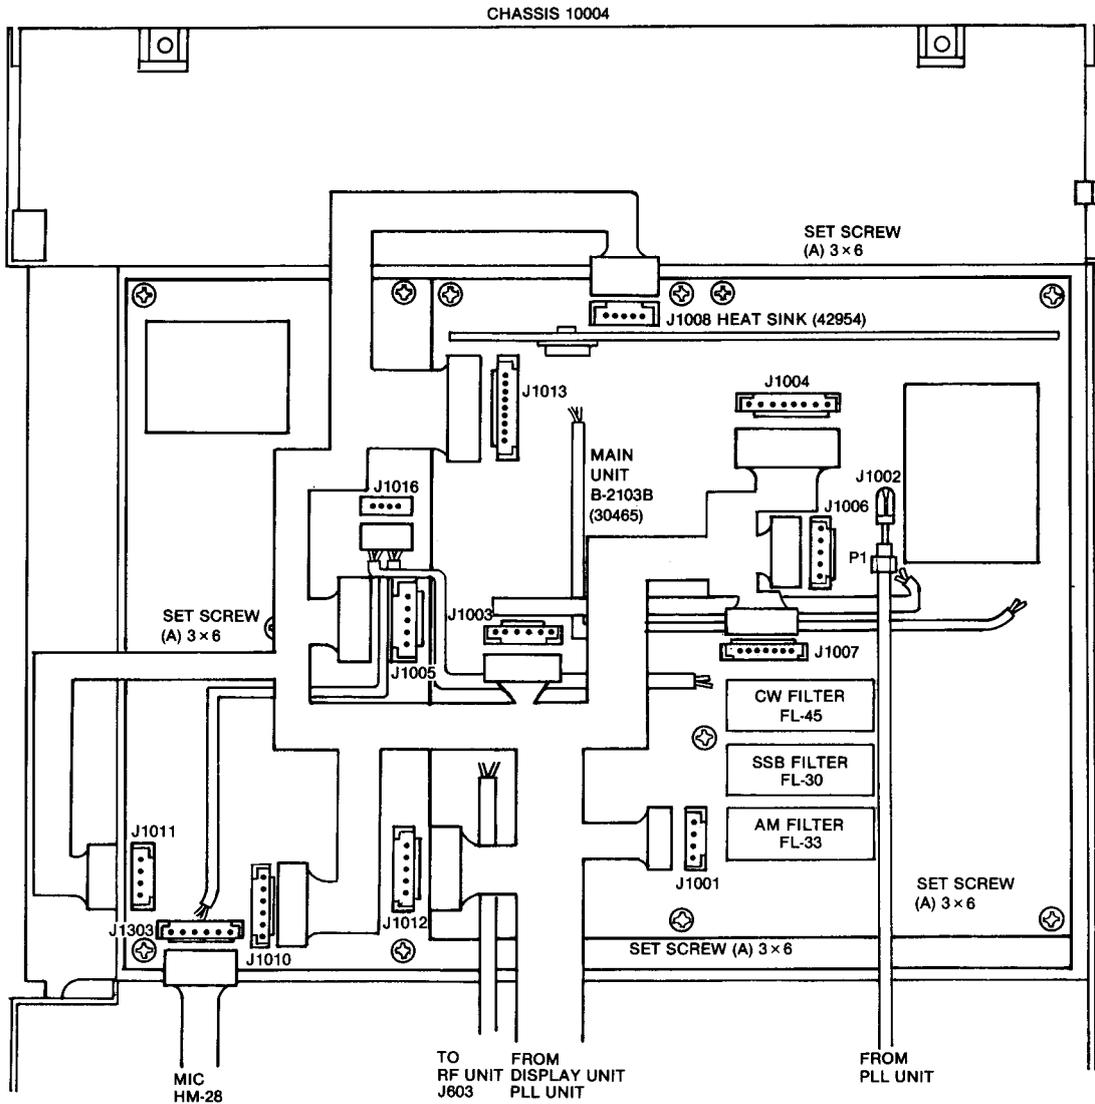

5-3 REAR PANEL DISASSEMBLY

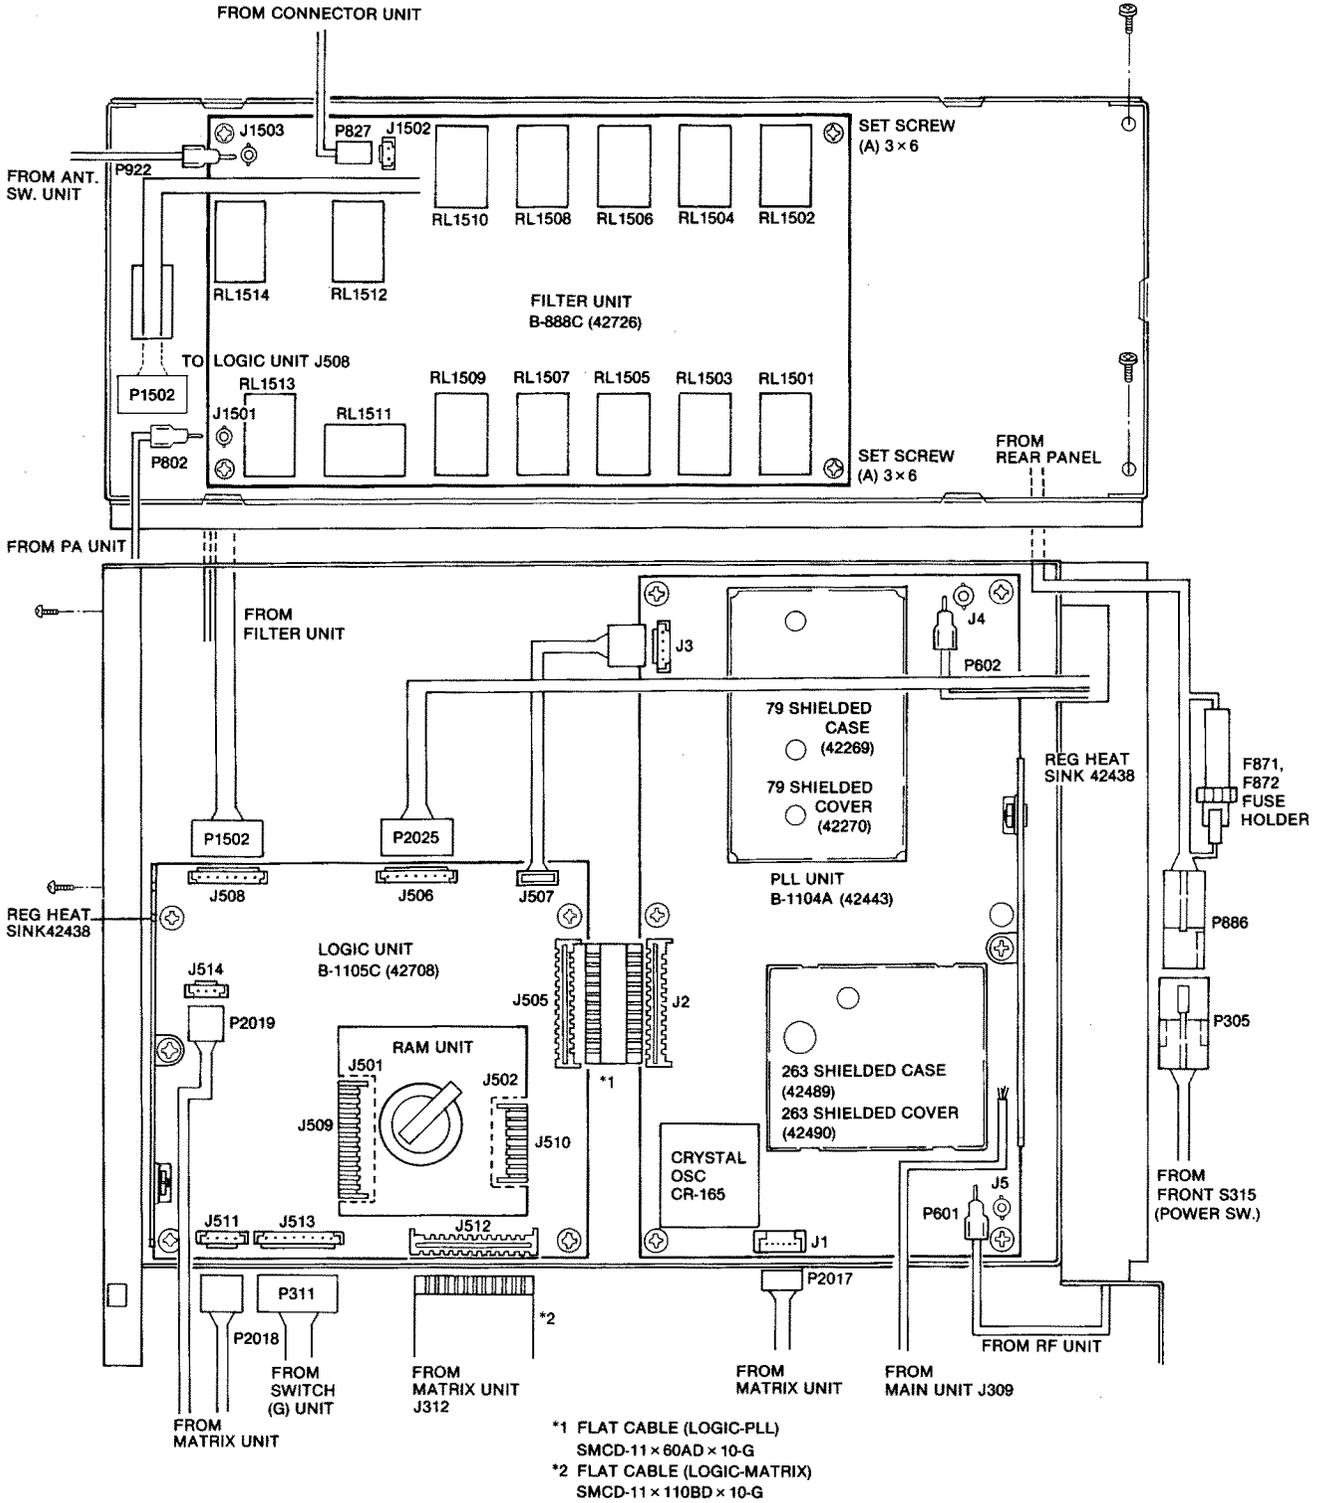

5-4 FRONT PANEL CONNECTOR CONNECTIONS (DISPLAY UNIT AND MATRIX UNIT)

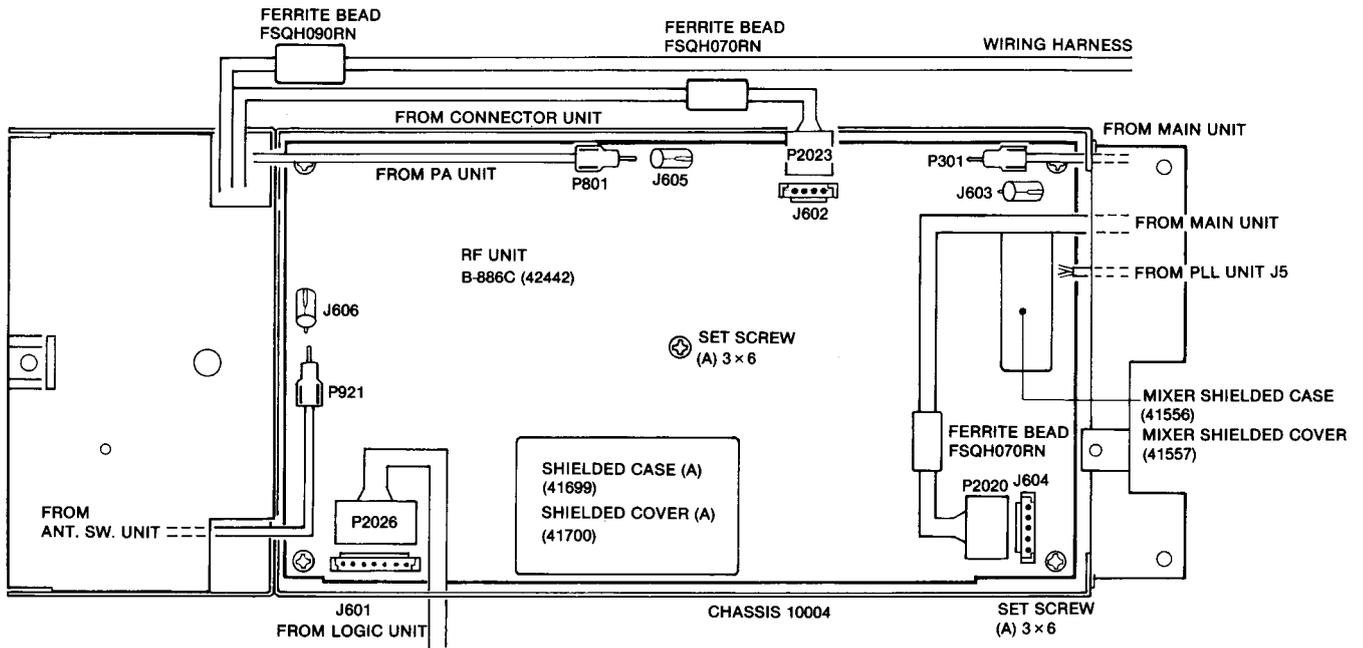

5-5 MAIN UNIT CONNECTOR CONNECTIONS

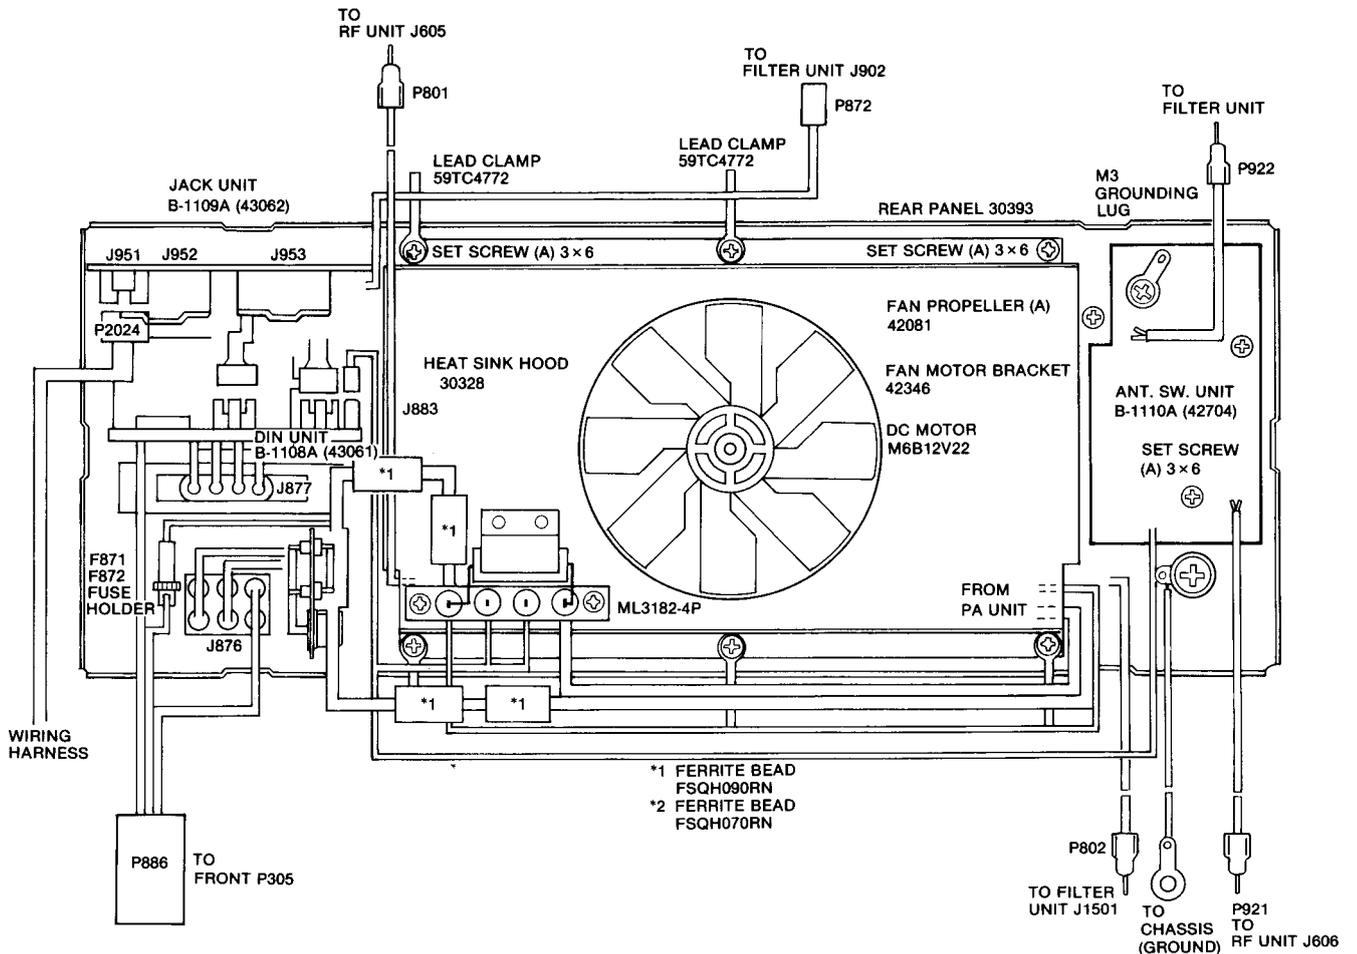

5-6 LOGIC-PLL UNIT AND FILTER UNIT CONNECTOR CONNECTIONS

5-7 RF UNIT CONNECTOR CONNECTIONS

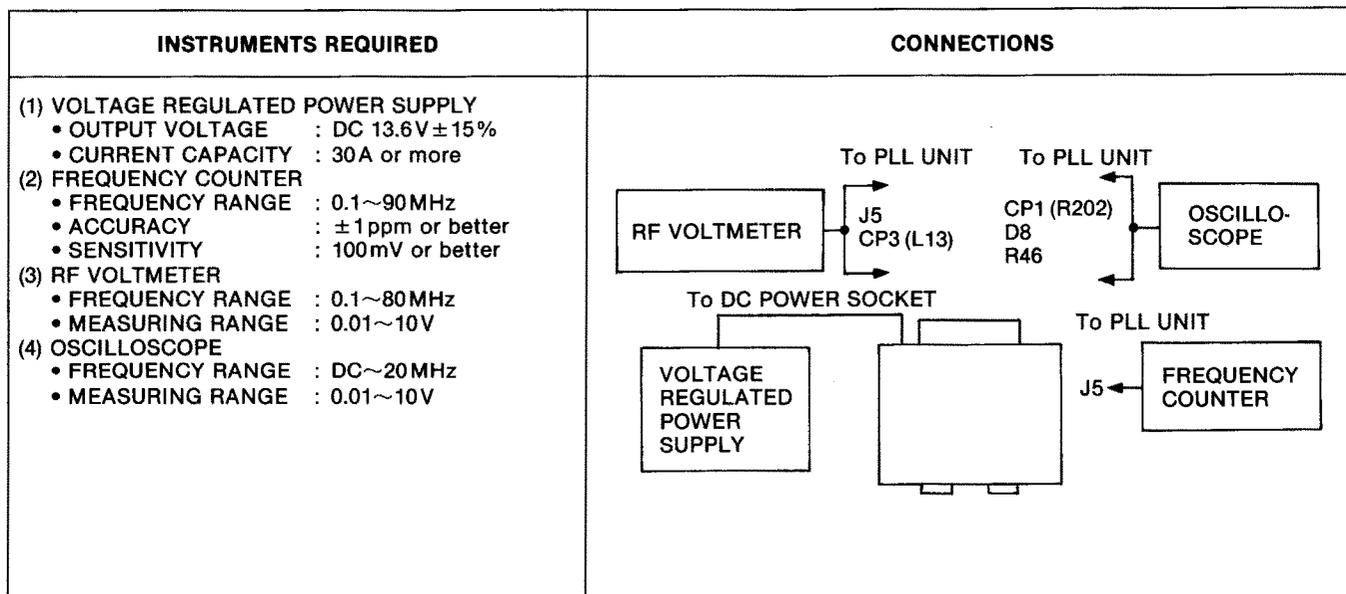

5-8 REAR PANEL CONNECTOR CONNECTIONS

**SECTION 6      MAINTENANCE AND ADJUSTMENT****6-1 PREPARATION BEFORE SERVICING**

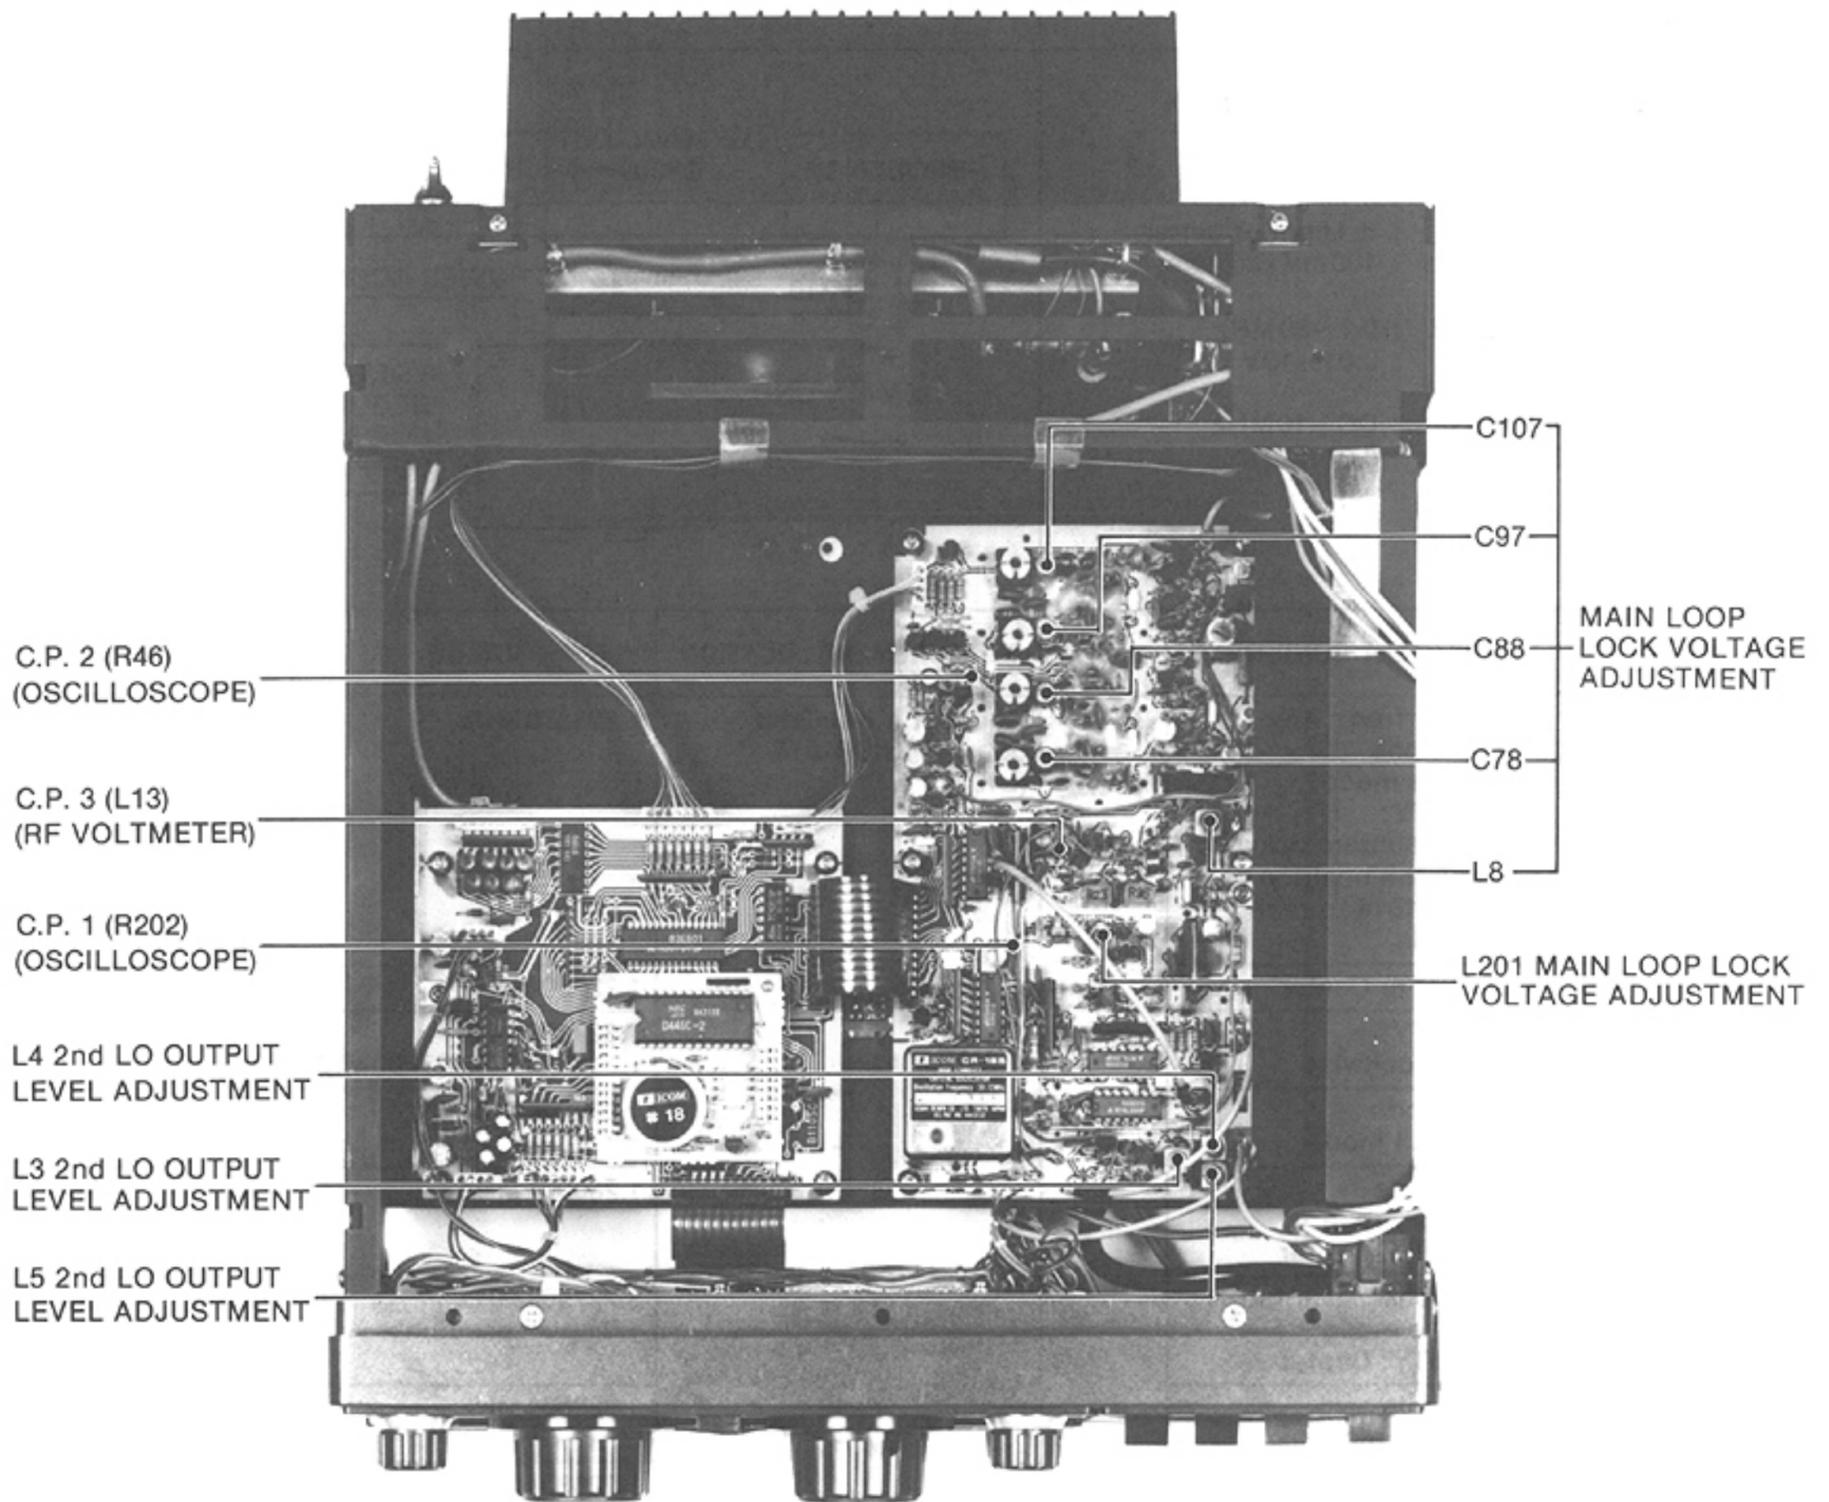

1. Detach the power cord and turn OFF the POWER SWITCH before performing any work on the transceiver.
2. Do not short circuit components while making adjustments.
3. Use an insulated tuning tool for all adjustments.
4. Do not force any of the variable components. Tune them slowly and smoothly.
5. Follow the instructions exactly. If an indicated result is not obtained, repeat the instruction until the correct result is obtained.
6. Check the condition of connectors, solder joints and screws when adjustments are complete. Confirm that components do not touch each other.
7. Confirm defective operation of the transceiver first when checking an out-of-service unit. Verify that external sources do not cause the problem.
8. Use the correct tools and test equipment.
9. Remove the transceiver case as shown in SECTION 5-1.
10. Attach a 13.6V DC external power source to the power supply connector. Be sure to check the polarity.
11. For transmission problems, attach a dummy load to the ANTENNA CONNECTOR. For reception problems, attach an antenna or signal generator to the ANTENNA CONNECTOR. Do not transmit into the signal generator.
12. Recheck for the suspected malfunction with the POWER SWITCH ON.
13. Check the defective circuit. Measure the DC voltages of the collector, base and emitter of each transistor.

6-2 PLL ADJUSTMENT

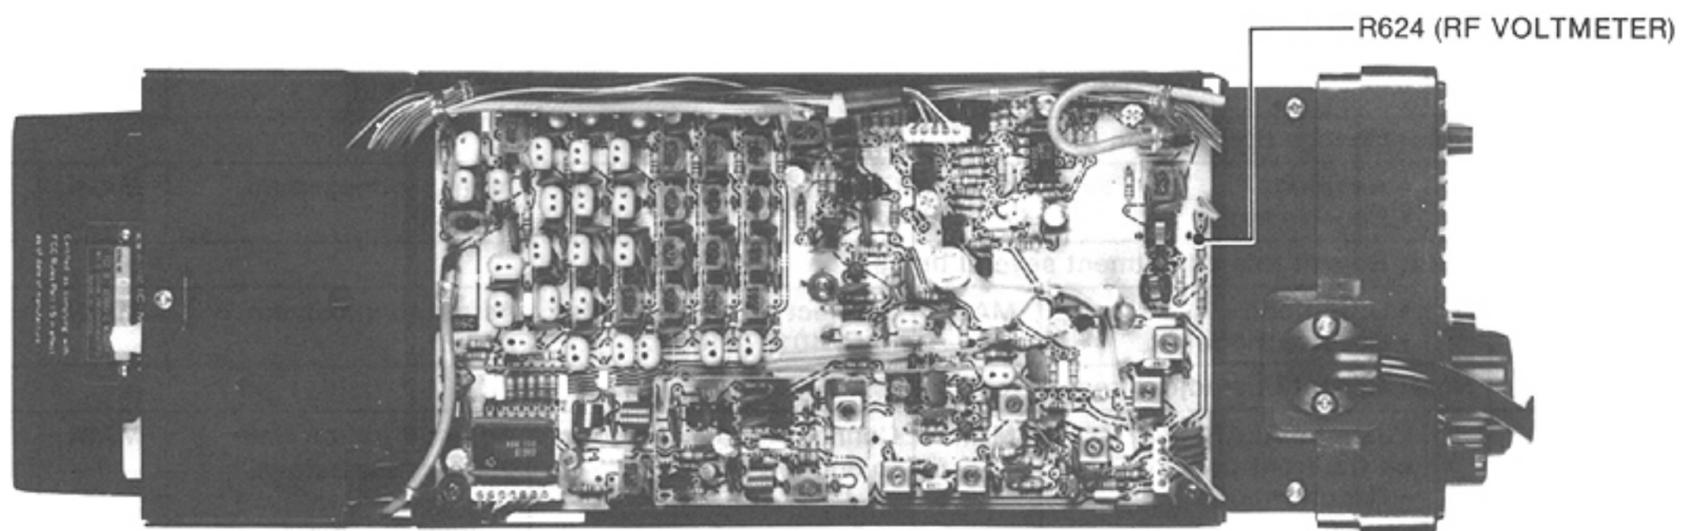

ADJUSTMENT	ADJUSTMENT CONDITIONS	UNIT	MEASUREMENT LOCATION	VALUE	UNIT	ADJUST
SUB LOOP LOCK VOLTAGE	1 • Display freq.: 6.9999MHz • MODE: Any	PLL	Connect an oscilloscope to CP1 (R202).	3V	PLL	L201
	2 • Display freq.: 6.9999MHz			Approx. 1.5V		Confirming
MAIN LOOP LOCK VOLTAGE	1 • Display freq.: 6.9999MHz • MODE: Any	PLL	Connect an RF voltmeter to CP3 (L13).	Adjust to maximum output: 200~400mVrms	PLL	L8
	2 • Display freq.: 6.9999MHz		Connect an oscilloscope to CP2 (R46).	6.5V		C78
	3 • Display freq.: 11.9999MHz					C88
	4 • Display freq.: 17.9999MHz					C97
	5 • Display freq.: 23.9999MHz					C107
2nd LO OUTPUT LEVEL	1 • Display freq.: Any • MODE: Any	RF	Connect an RF voltmeter to R624 (coaxial cable side)	Adjust to maximum output: +1~+5dBm/50Ω	PLL	L3~L5

IC7	TC4013BP (DUAL "D" FLIP-FLOP WITH SET/RESET CAPABILITY)	

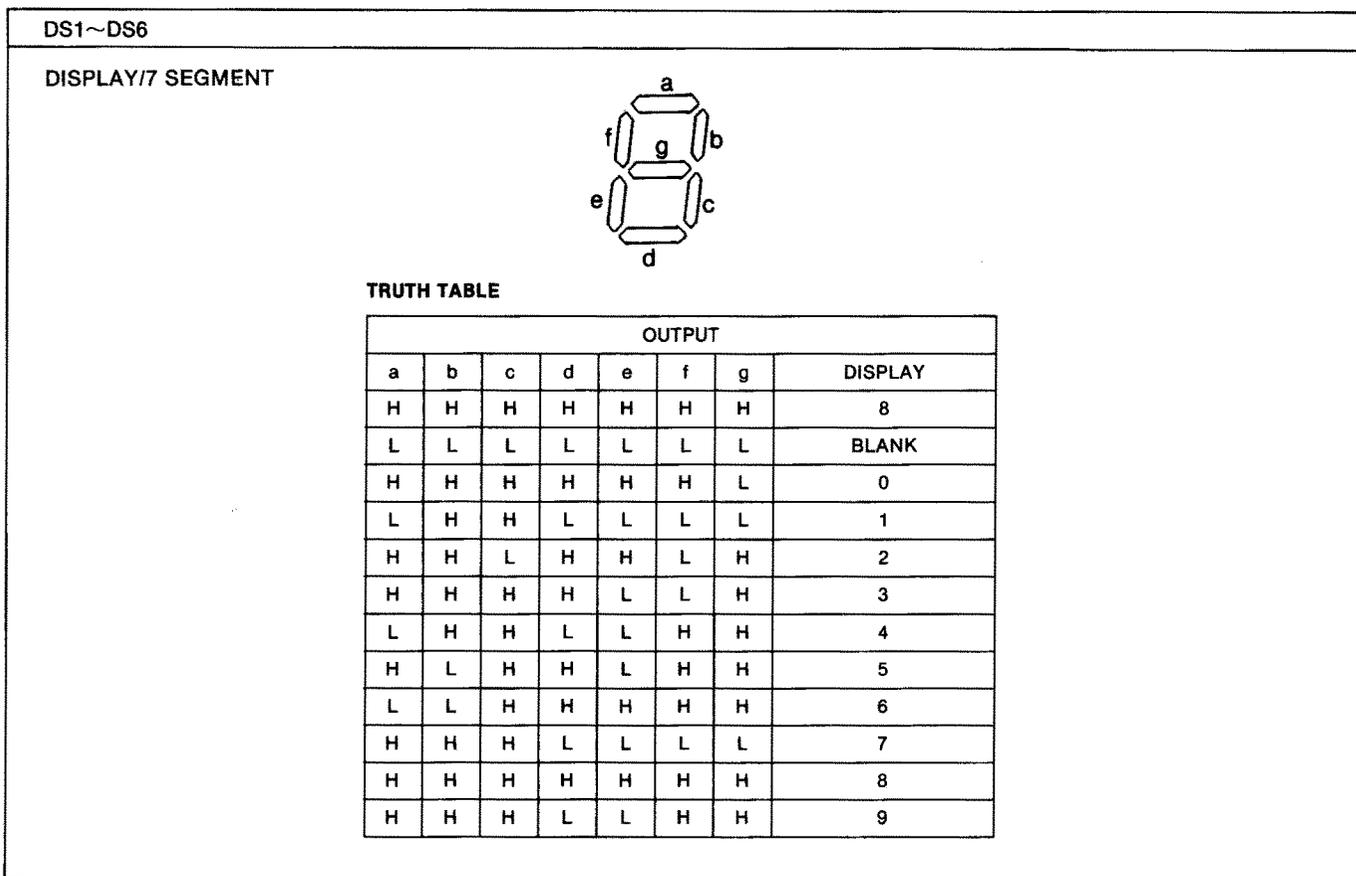

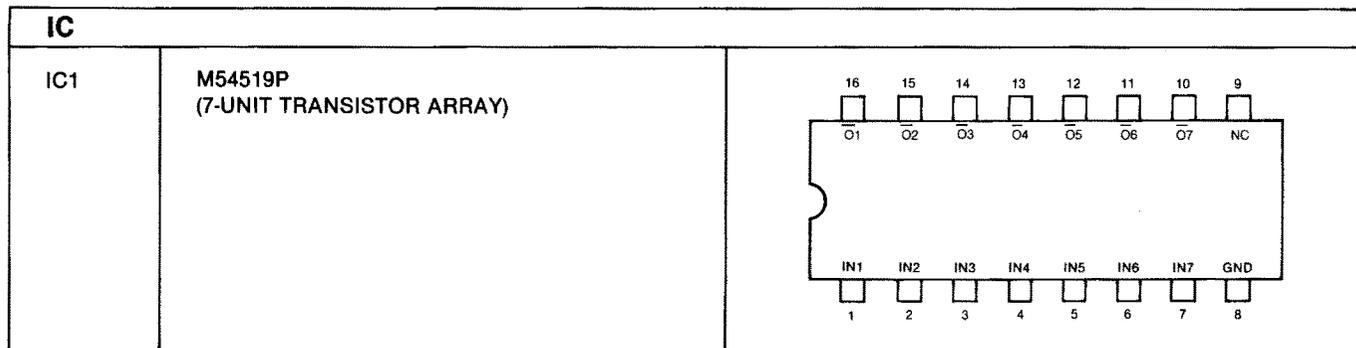

TRANSISTOR		
<p>Q1, Q2 2SA1048</p> 	<p>Q3, Q10, Q21 2SC2458</p> 	<p>Q4, Q9, Q12, Q13, Q19 2SC3399</p> 
<p>Q5, Q6, Q17, Q20, Q22 2SA1345</p> 	<p>Q7, Q8, Q11 2SA1348</p> 	

• MATRIX UNIT

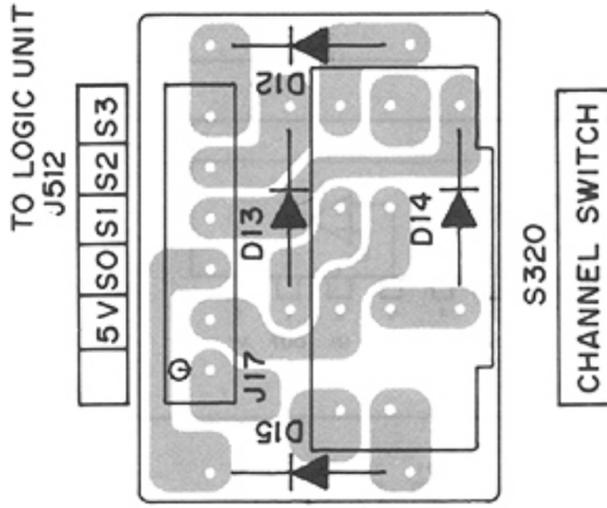

NOTE: Add "300" to the indicated number on the unit for actual part number respectively.

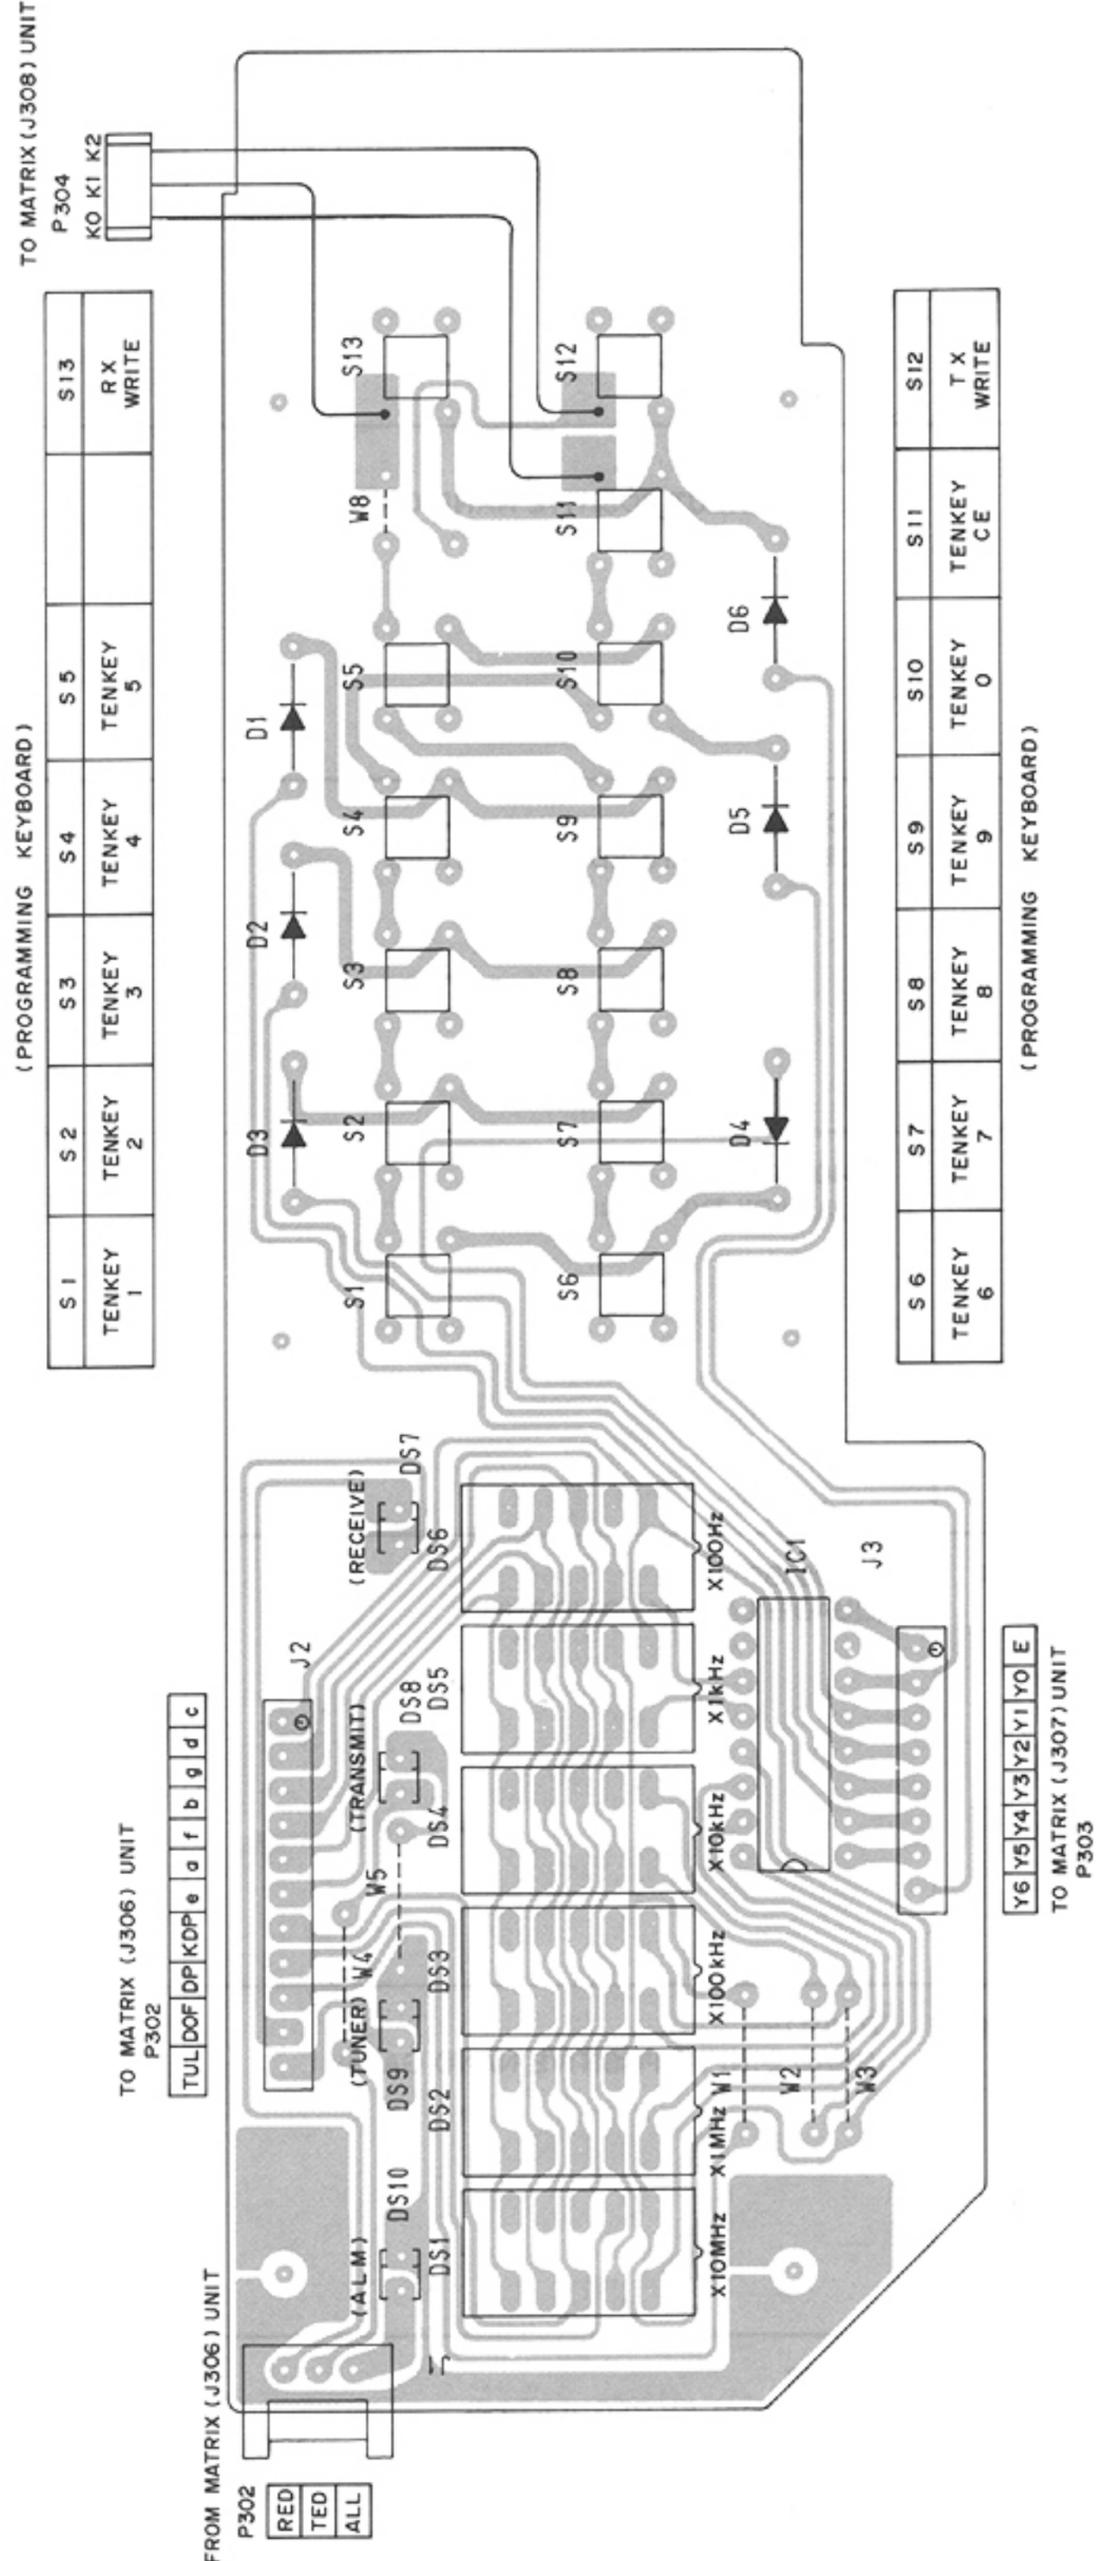

8-3 FRONT UNIT (DISPLAY AND CHANNEL SWITCH)

• CHANNEL SWITCH UNIT

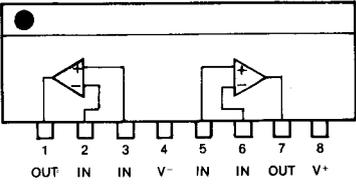

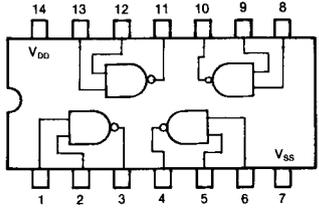

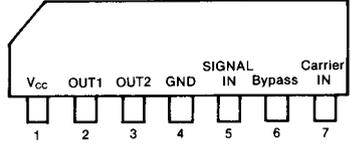

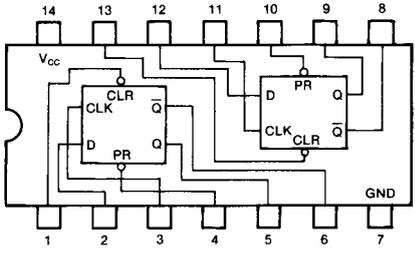

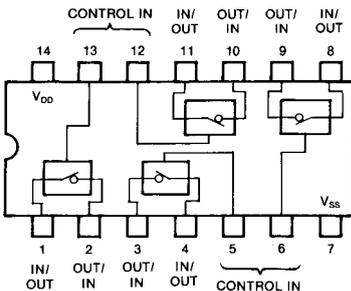

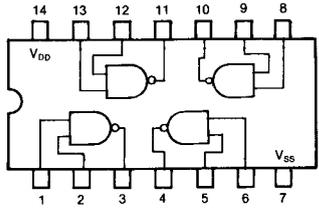

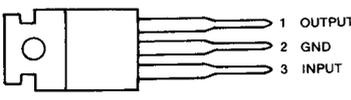

• DISPLAY UNIT

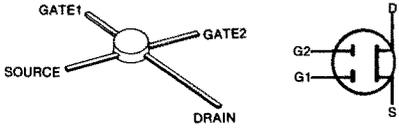

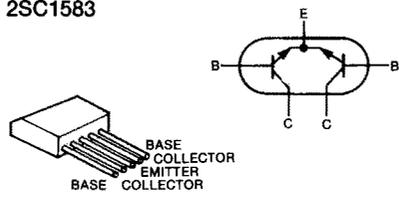

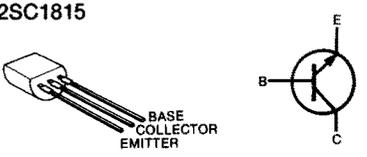

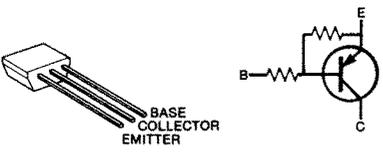

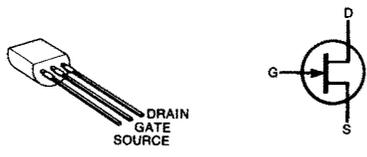

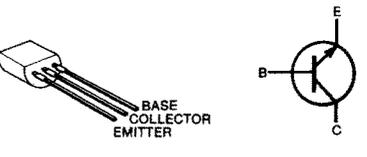

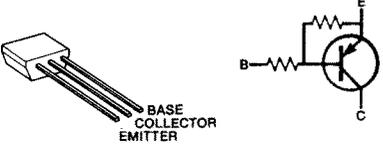

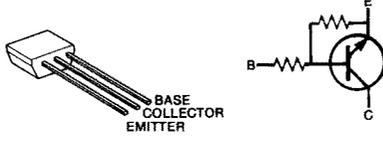

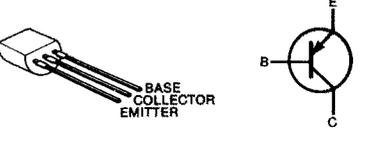

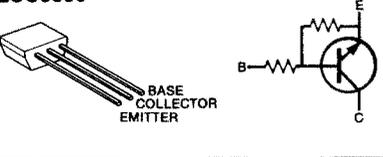

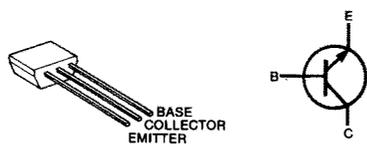

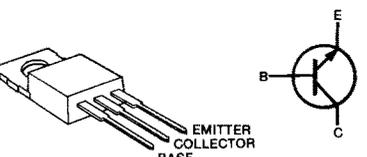

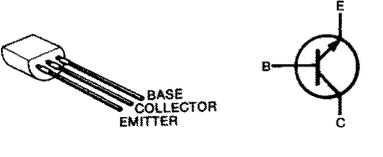

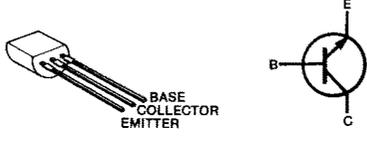

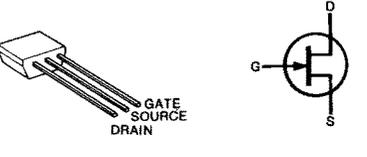

NOTE: Add "300" to the indicated number on the unit for actual part number respectively.

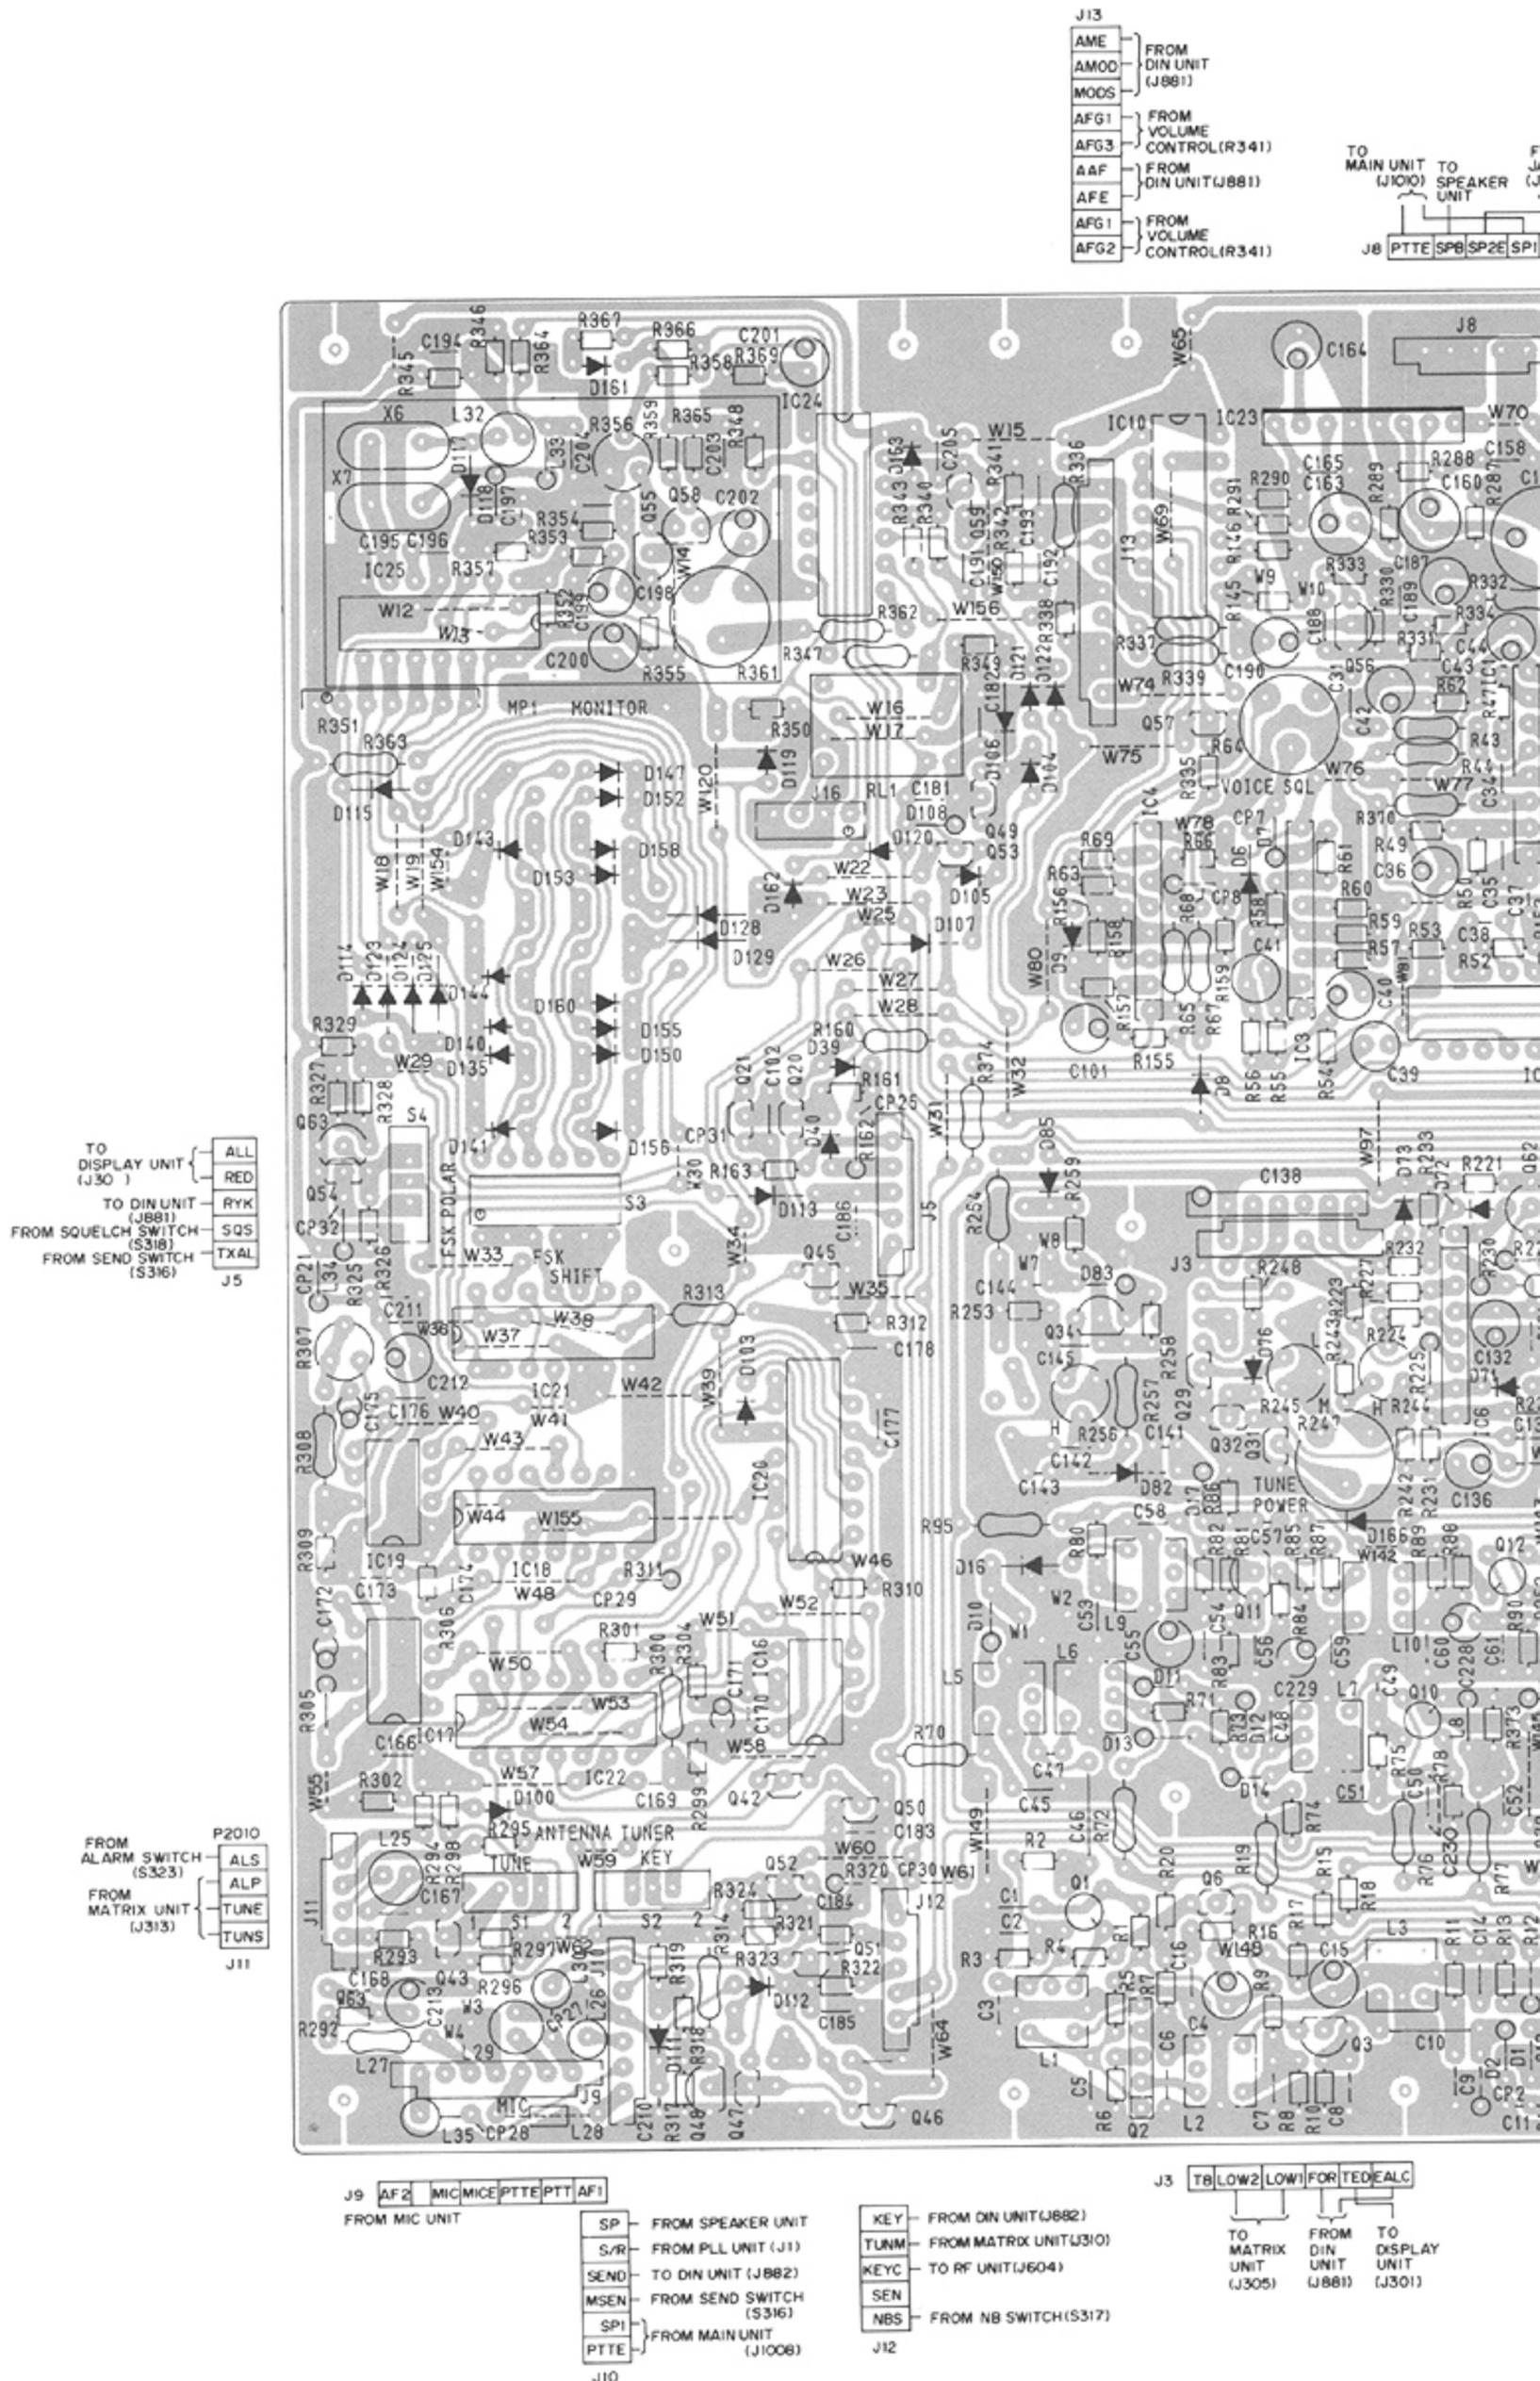

8-4 MAIN UNIT

IC		
IC1, 3, 4, 5, 6	M5218L (LOW NOISE DUAL OPERATIONAL AMPLIFIER)	
IC2, 22	TC4011UBP (QUAD 2-INPUT POSITIVE NAND GATE)	
IC7, 8, 11	μPC1037H (DOUBLE BALANCED MODULATOR)	
IC9	TC40H074P (DUAL "D" TYPE FLIP FLOP)	
IC10, 24	TC4066BP (QUAD BILATERAL SWITCH)	
IC12, 14	TC4011BP (QUAD 2-INPUT POSITIVE NAND GATE)	
IC13	μA7808 (3-TERMINAL 8V REGULATOR)	

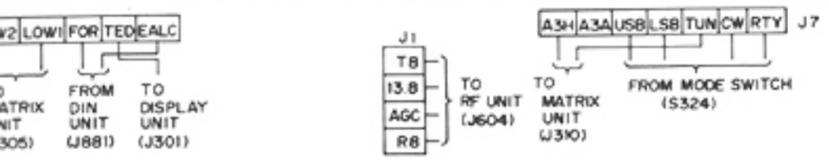

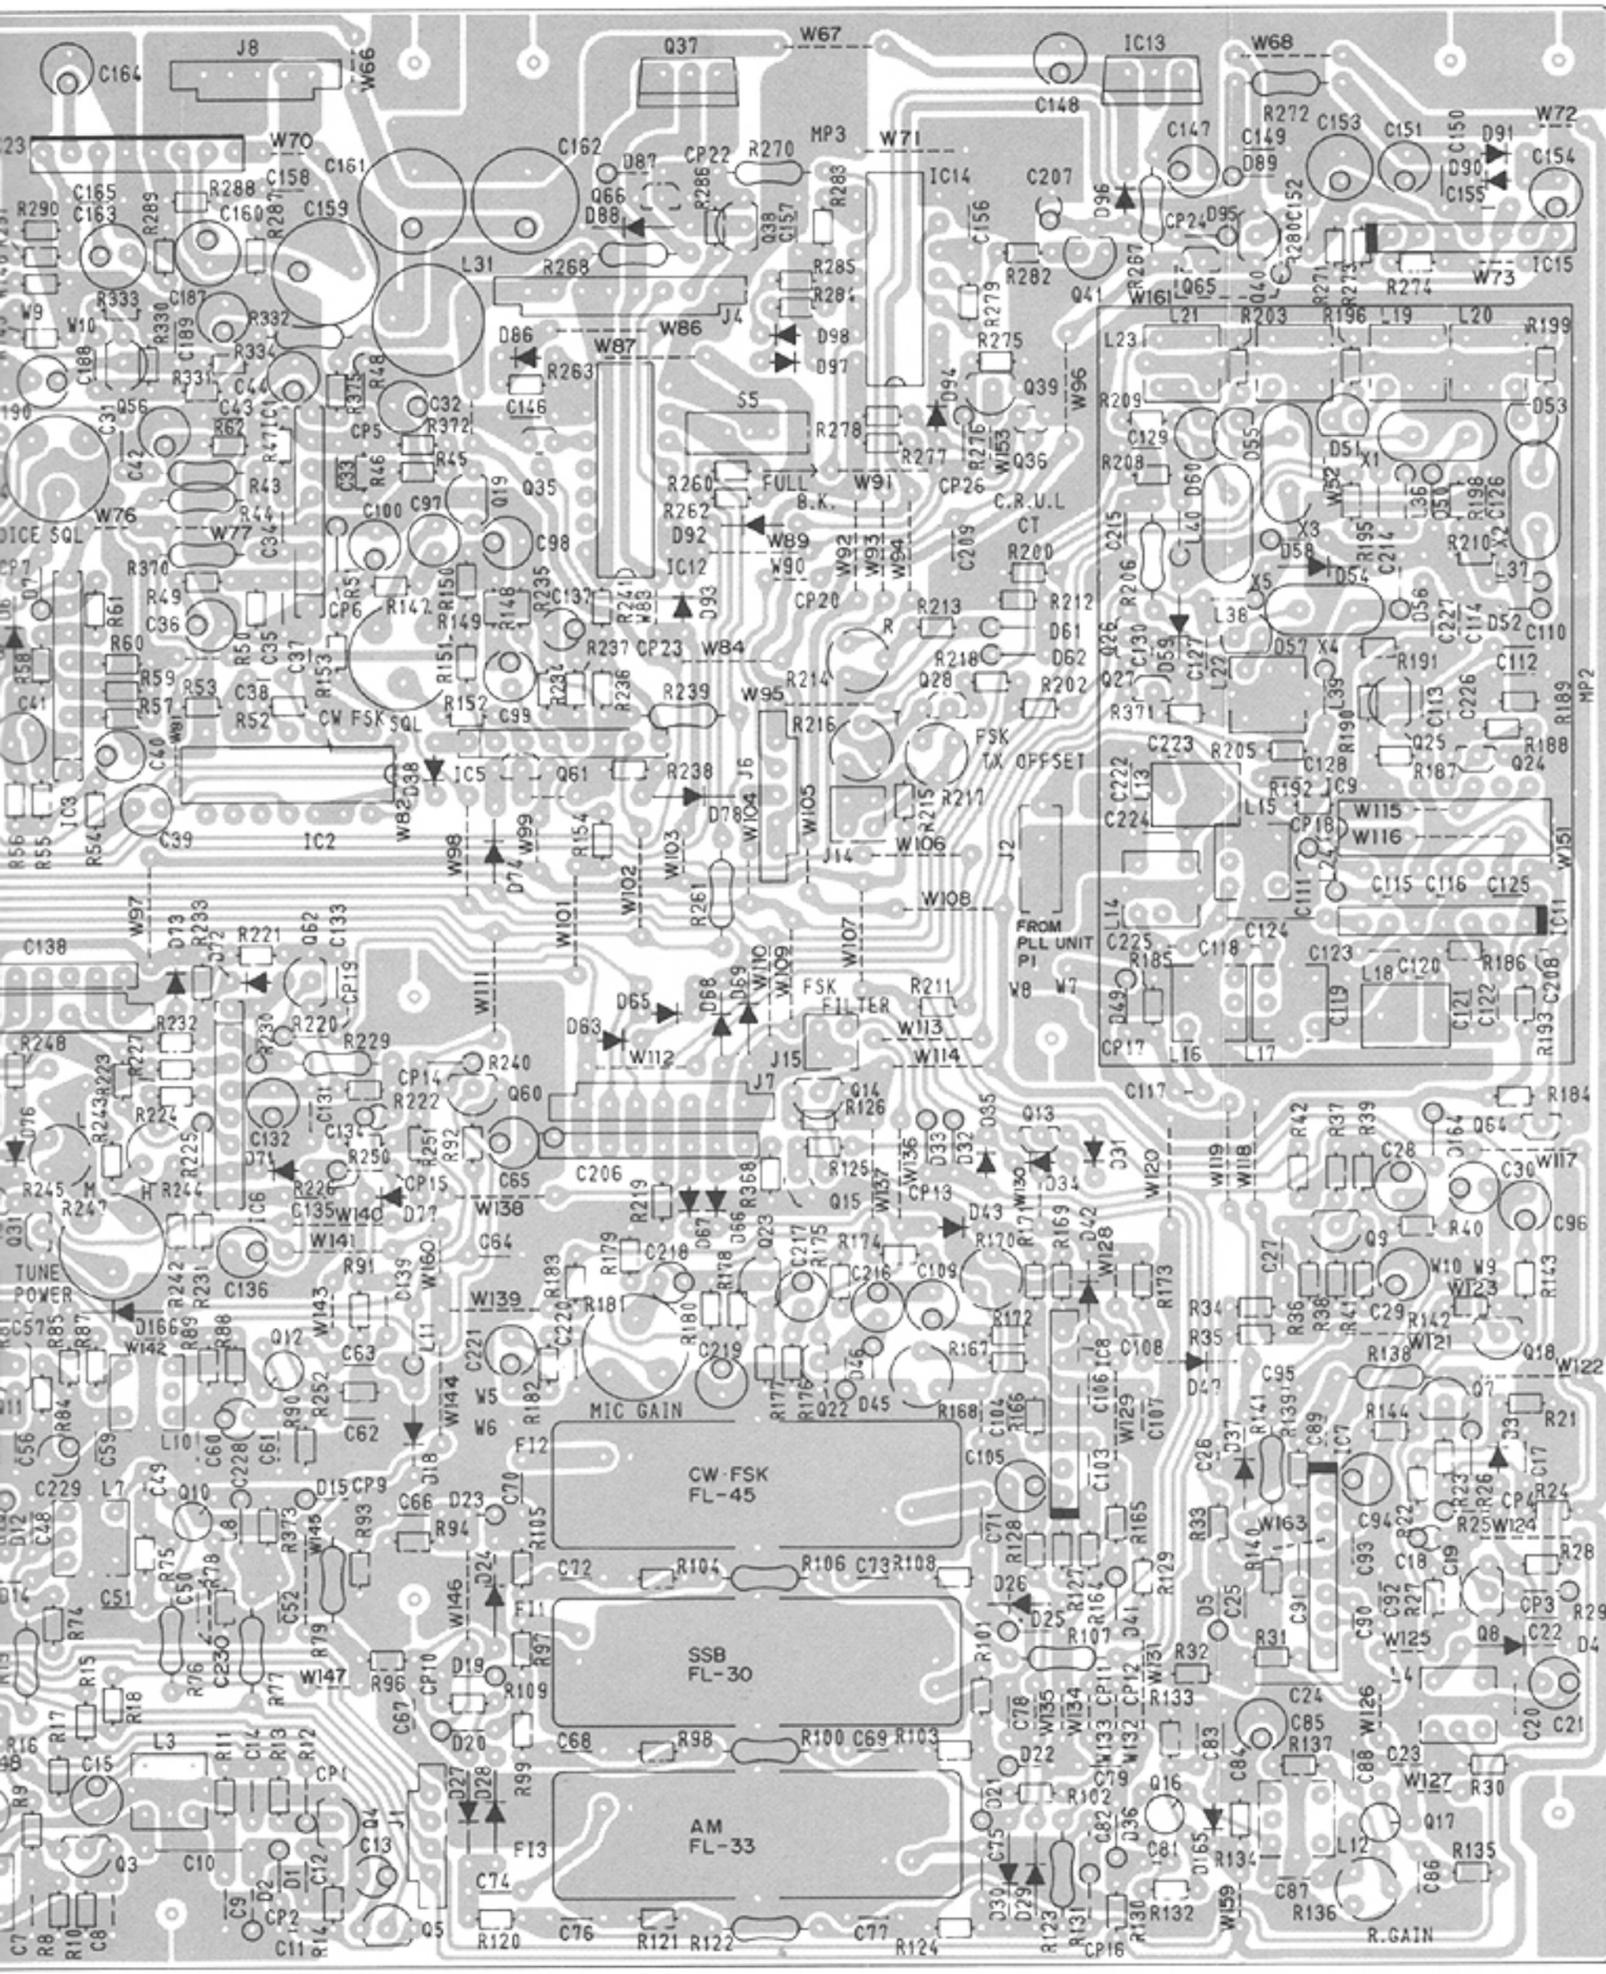

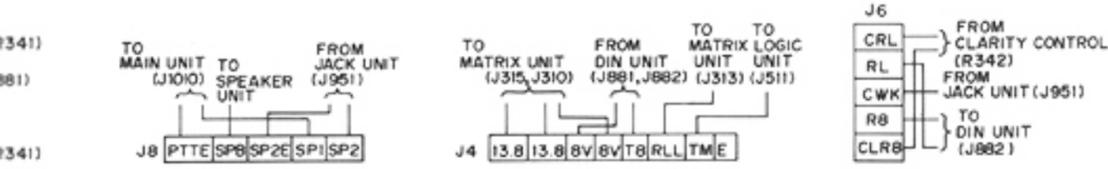

IC		
IC15	BA222 (MONOLITHIC TIMER)	
IC16, 17, 19	$\mu$ A555TC (TIMER)	
IC18	TC4013BP (DUAL "D" FLIP-FLOP WITH SET/RESET CAPABILITY)	
IC20, 21	TC4001UBP (QUAD 2-INPUT POSITIVE NOR GATE)	
IC23	$\mu$ PC1241H (5.8W AUDIO POWER AMPLIFIER)	
IC25	S-7116A (PROGRAMMABLE TONE GENERATOR)	

TRANSISTOR		
<p><b>Q1, Q10, Q12, Q16, Q17</b> 3SK74</p> 	<p><b>Q2</b> 2SC1583</p> 	<p><b>Q3, Q4, Q5, Q8, Q11, Q14, Q25, Q34, Q39, Q48, Q55, Q60, Q63</b> 2SC1815</p> 
<p><b>Q6</b> 2SA1348</p> 	<p><b>Q7, Q58</b> 2SK30A</p> 	<p><b>Q9, Q18, Q23, Q56</b> 2SC1571</p> 
<p><b>Q13, Q27, Q61</b> 2SA1345</p> 	<p><b>Q15, Q20, Q21, Q49, Q53</b> 2SC3402</p> 	<p><b>Q19, Q62</b> 2SA1015</p>

• MAIN UNIT

NOTE: Add "1000" to the indicated number on the unit for actual part number respectively.

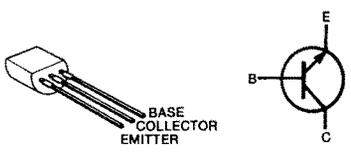

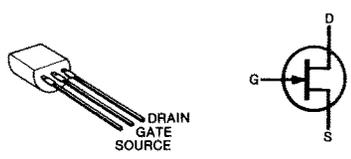

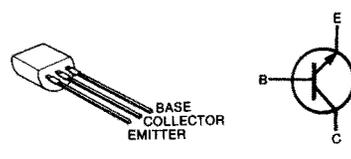

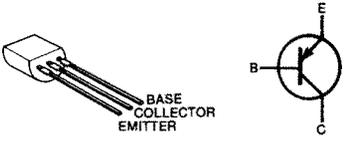

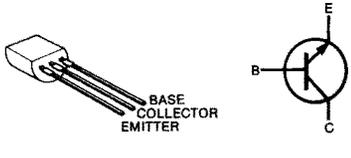

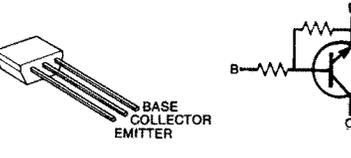

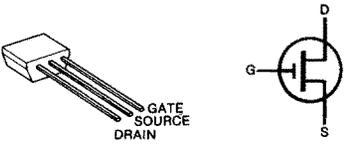

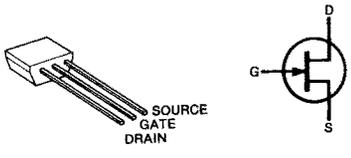

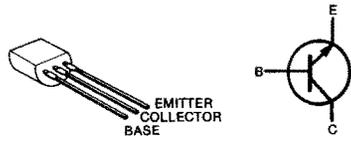

8-5 FILTER UNIT

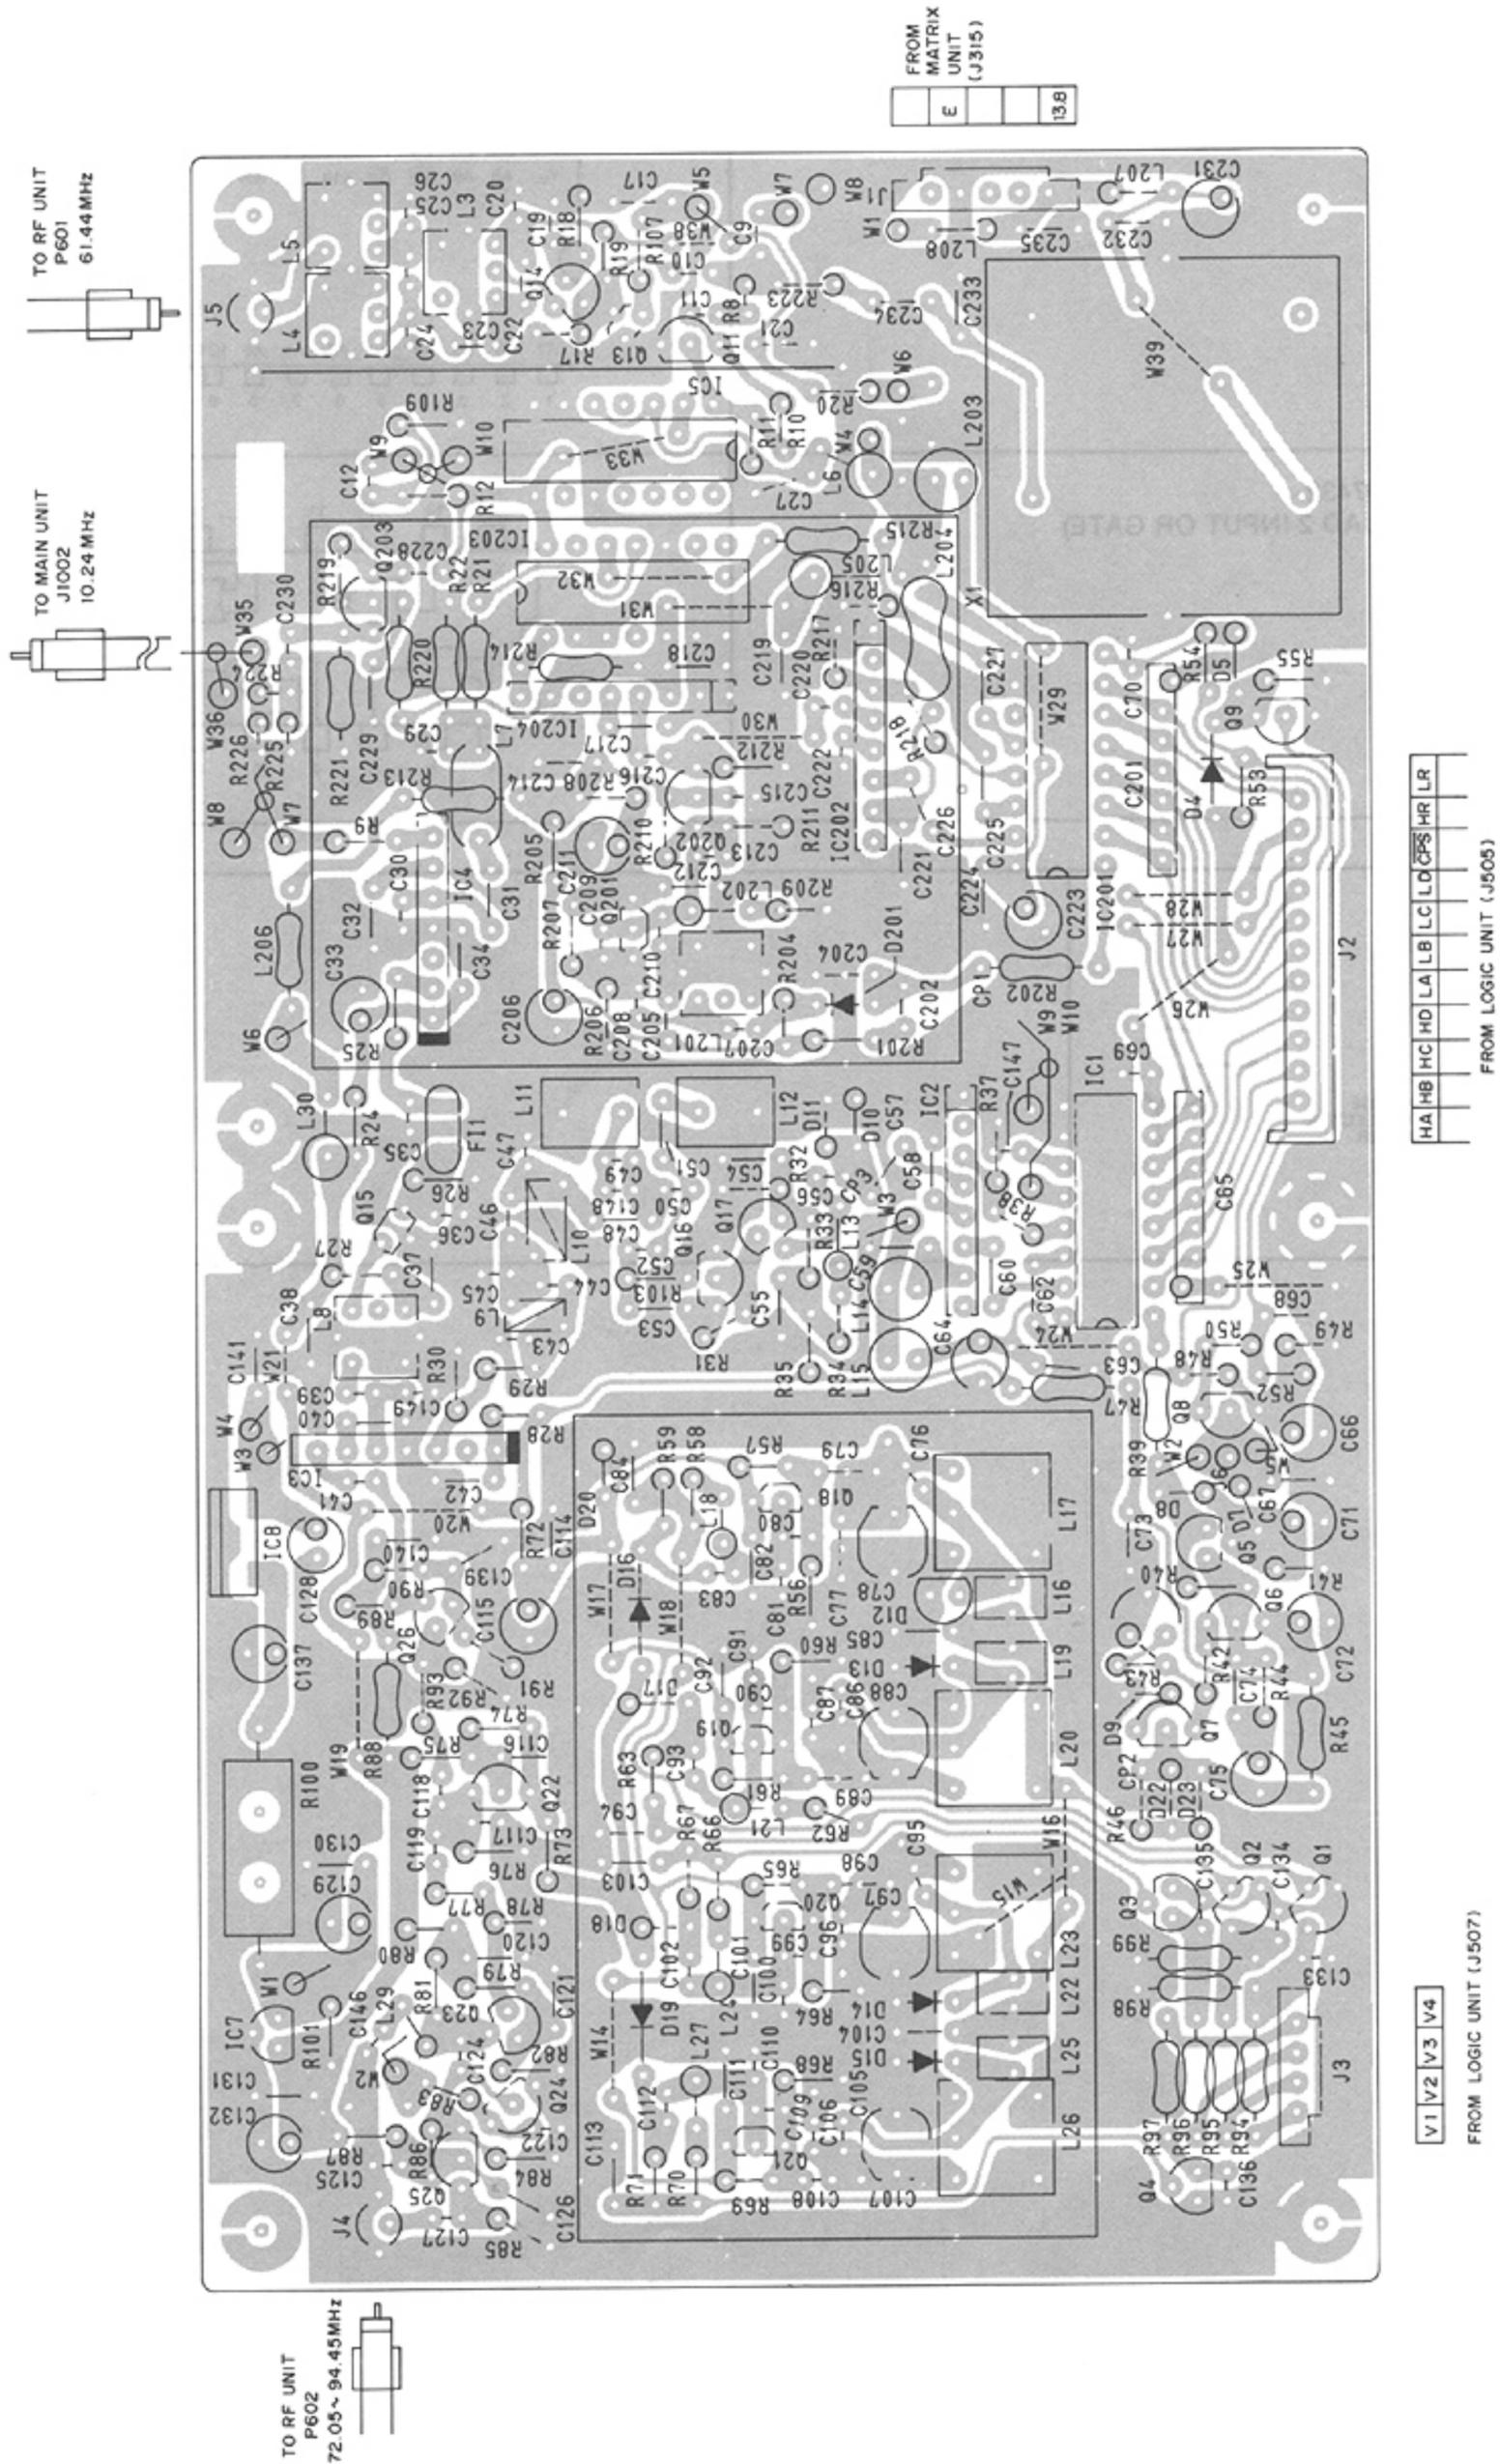

NOTE: Add "1500" to the indicated number on the unit for actual part number respectively.

8-6 PLL UNIT

IC		
IC1, 201	M54929P (DUAL MODULUS PLL IC)	
IC2, 202	M54466L (1/10, 1/11 DIVIDER)	
IC3, 4	$\mu$ PC1037H (DOUBLE-BALANCED MODULATOR)	
IC5, 203	M74LS90P (DECODE COUNTER)	
IC7	TA78L008AP (3-TERMINAL 8V REGULATOR)	<p>(BOTTOM VIEW)</p>
IC8	$\mu$ A7805 (3-TERMINAL 5V REGULATOR)	
IC204	M54459L (1/20, 1/100 HIGH SPEED DIVIDER)	

TRANSISTOR		
<p>Q1, Q2, Q3, Q4, Q9, Q24, Q203 2SC945</p> 	<p>Q5, Q6 2SK30A</p> 	<p>Q7 2SC1571</p> 
<p>Q8 2SA1015</p> 	<p>Q11, Q24, Q16, Q17, Q22, Q23, Q25, Q26 2SC383TM</p> 	<p>Q13 2SC3399</p> 
<p>Q15 2SK241</p> 	<p>Q18, Q19, Q20, Q21, Q201 2SK192A</p> 	<p>Q202 2SC763</p> 

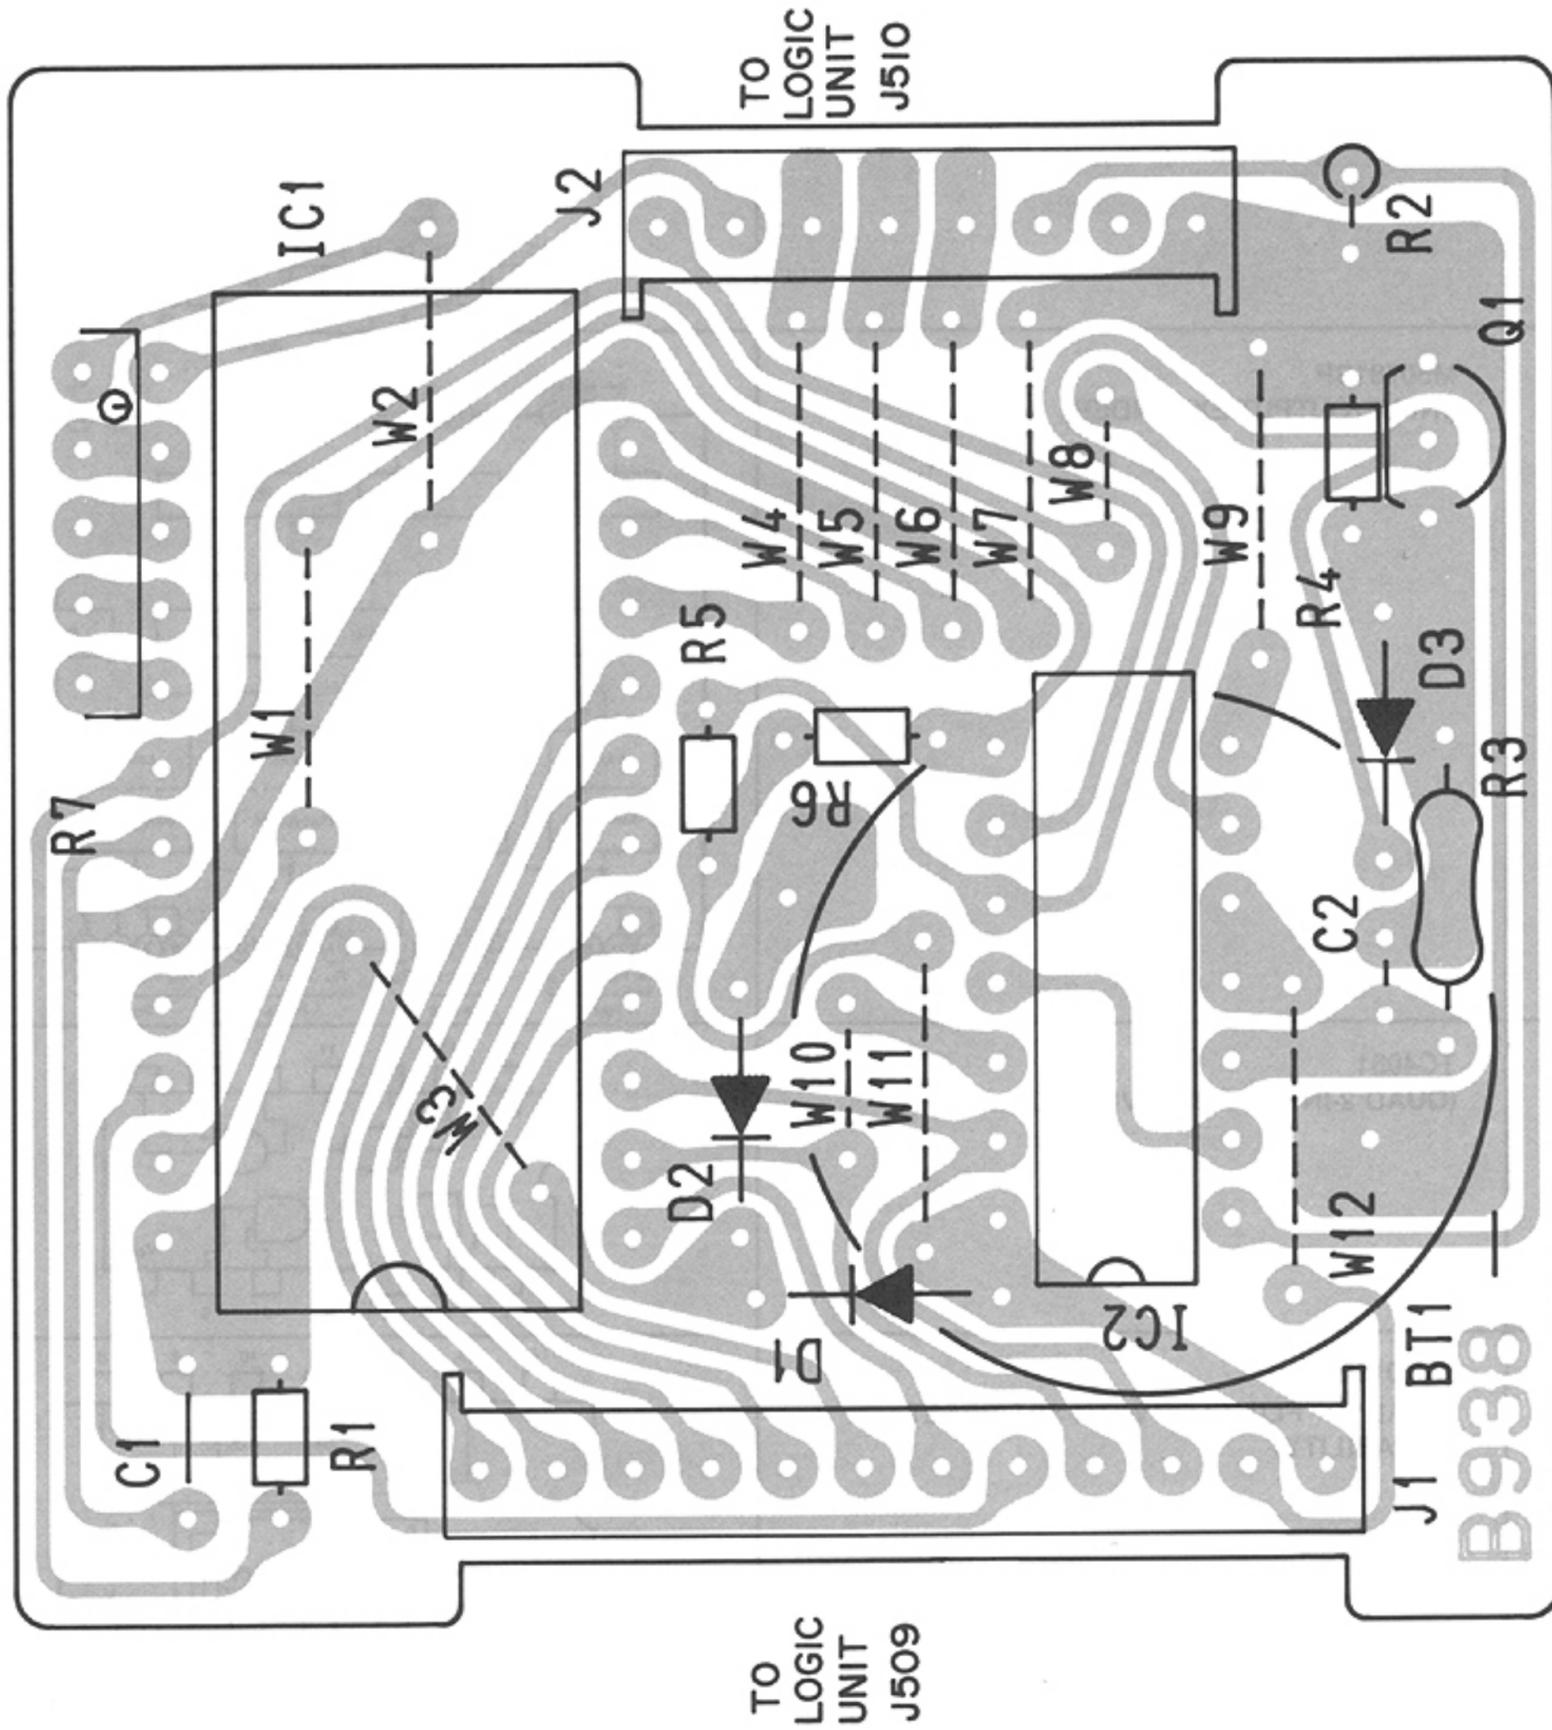

• PLL UNIT

8-7 RAM UNIT

IC		
IC1	<p><math>\mu</math>PD446C-1 (RANDOM ACCESS MEMORY)</p>	
IC2	<p>HD7432 (QUAD 2-INPUT OR GATE)</p>	
TRANSISTOR		
<p>Q1 2SC945P</p>		

• RAM UNIT

NOTE: Add "500" to the indicated number on the unit for actual part number respectively.

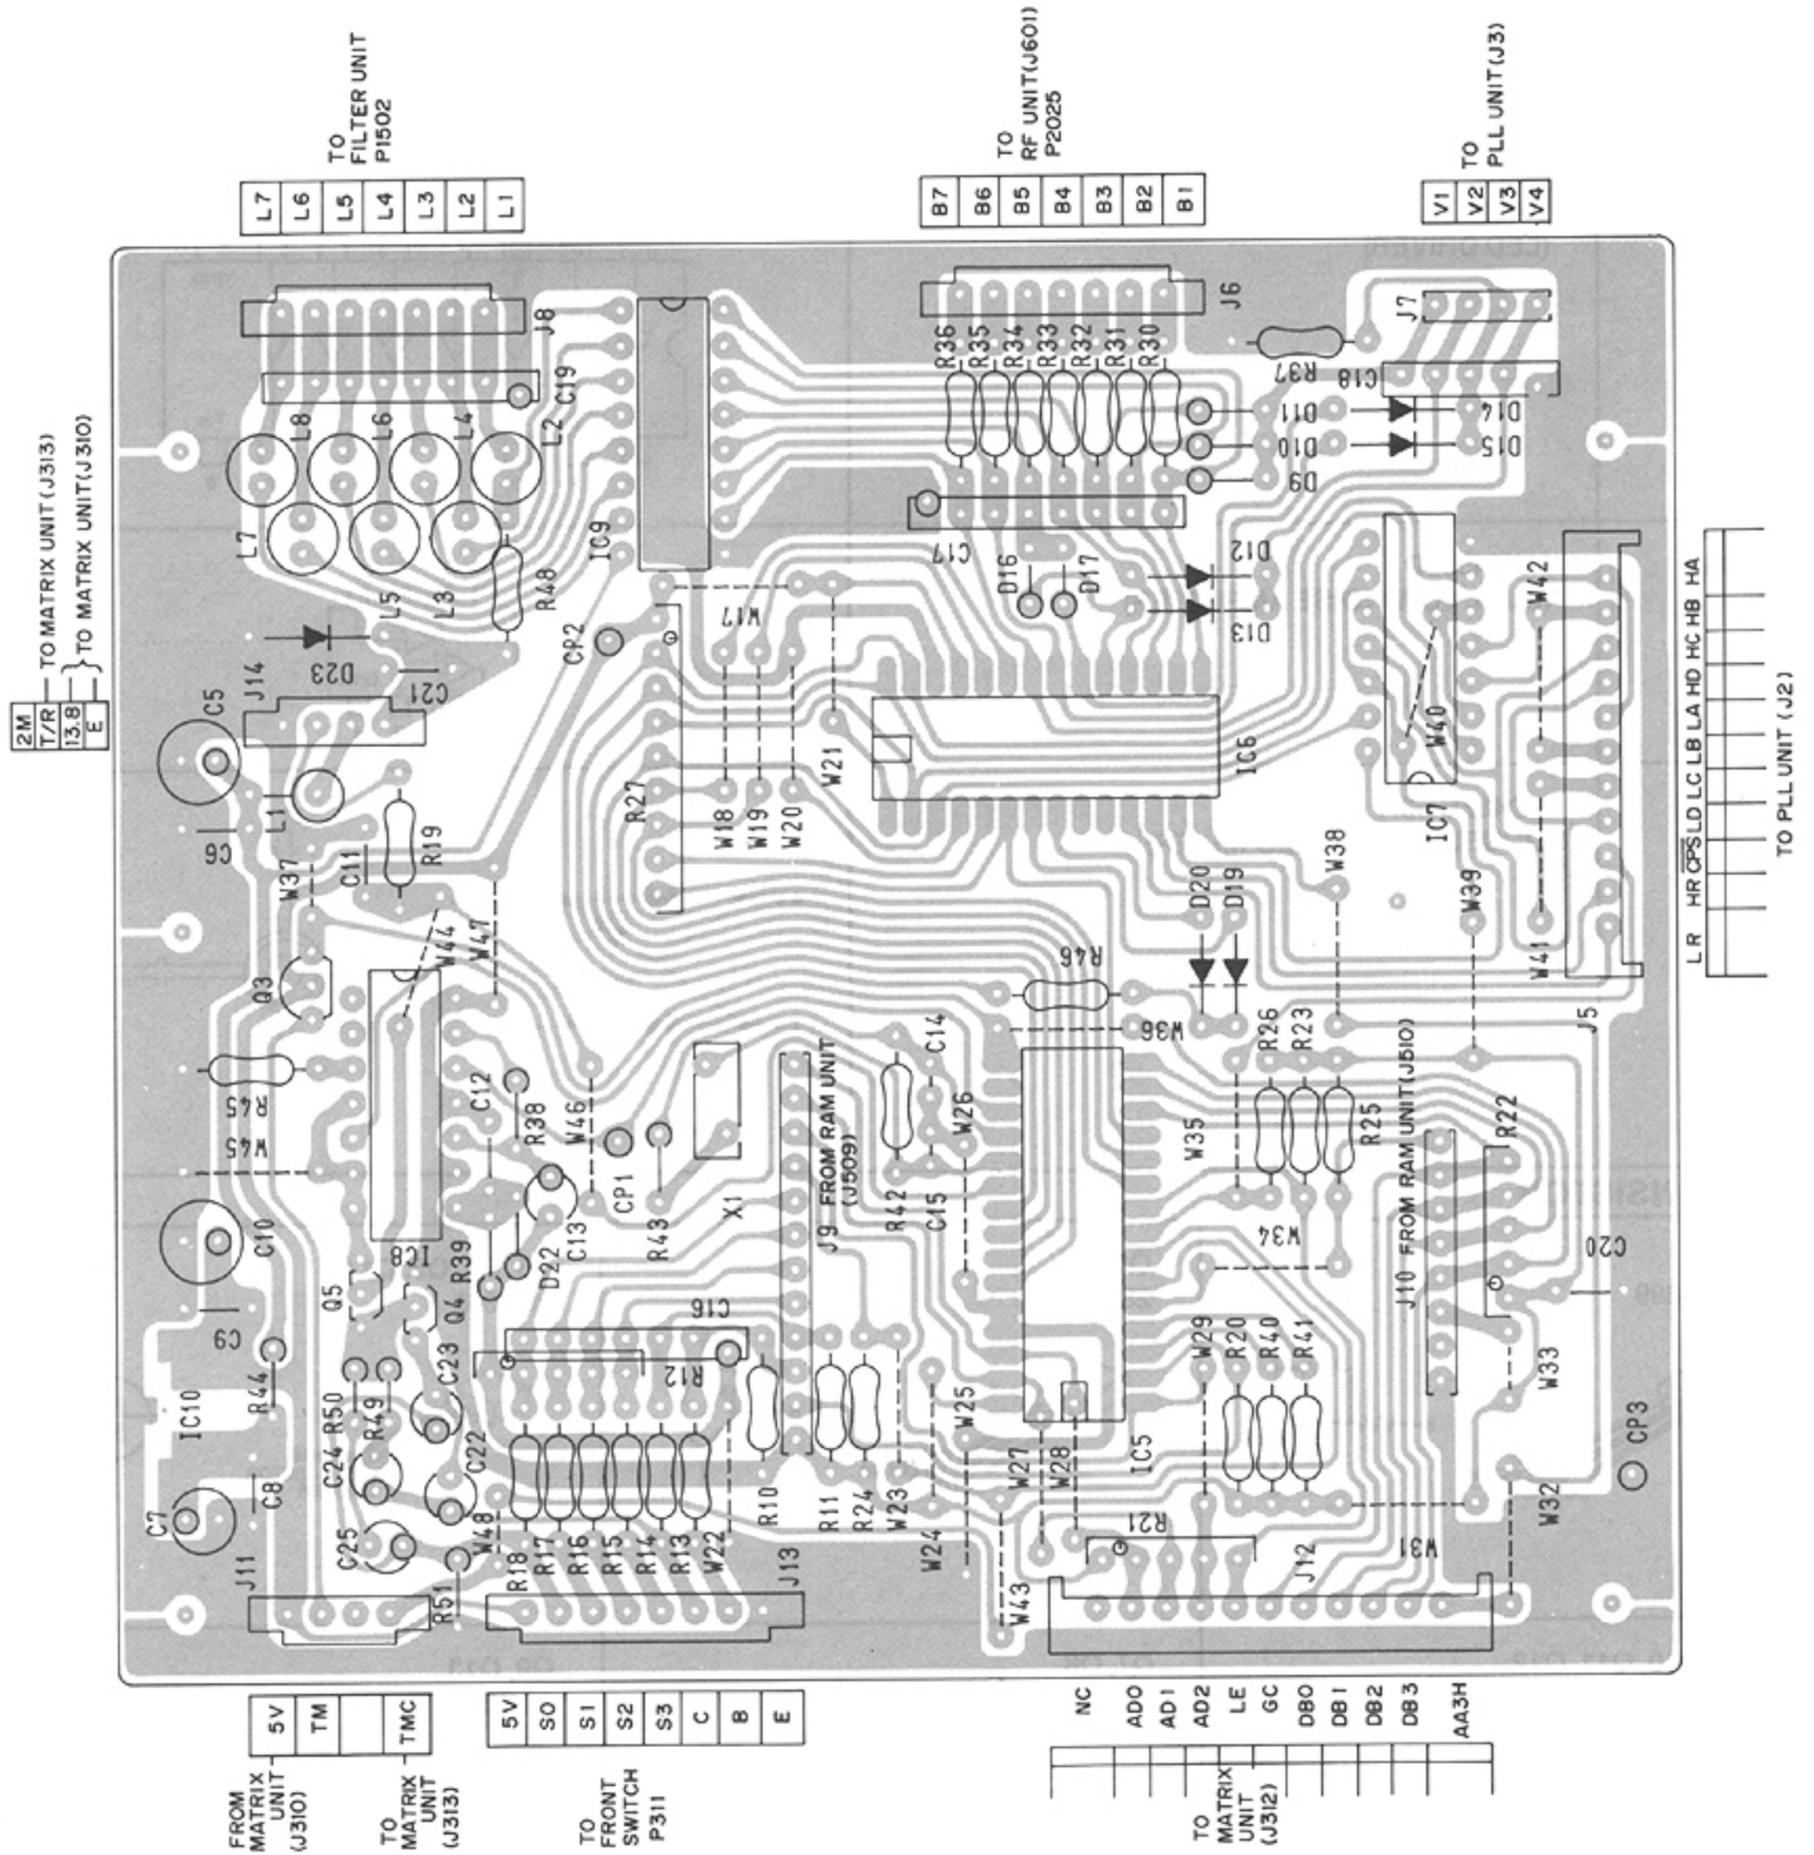

8-8 LOGIC UNIT

IC		
IC5	M50763-537SP (CPU)	
IC6	M50781SP (INPUT/OUTPUT EXPANDER)	
IC7	TC4081 (QUAD 2-INPUT POSITIVE AND GATE)	
IC8	TC4013BP (DUAL 'D' FLIP-FLOP WITH SET/RESET CAPABILITY)	
IC9	BA618 (LED DRIVER)	
IC10	F7805 (3-TERMINAL 5V REGULATOR)	

TRANSISTOR

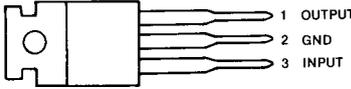

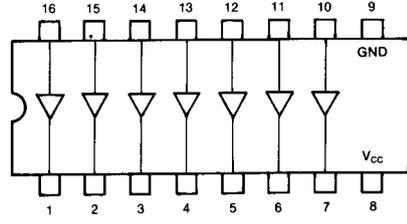

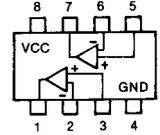

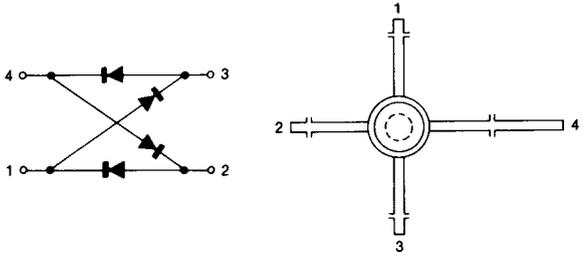

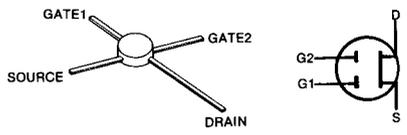

<p>Q3 2SC945P</p>	<p>Q4 2SA1345</p>	<p>Q5 2SC3399</p>
-----------------------	-----------------------	-----------------------

• LOGIC UNIT

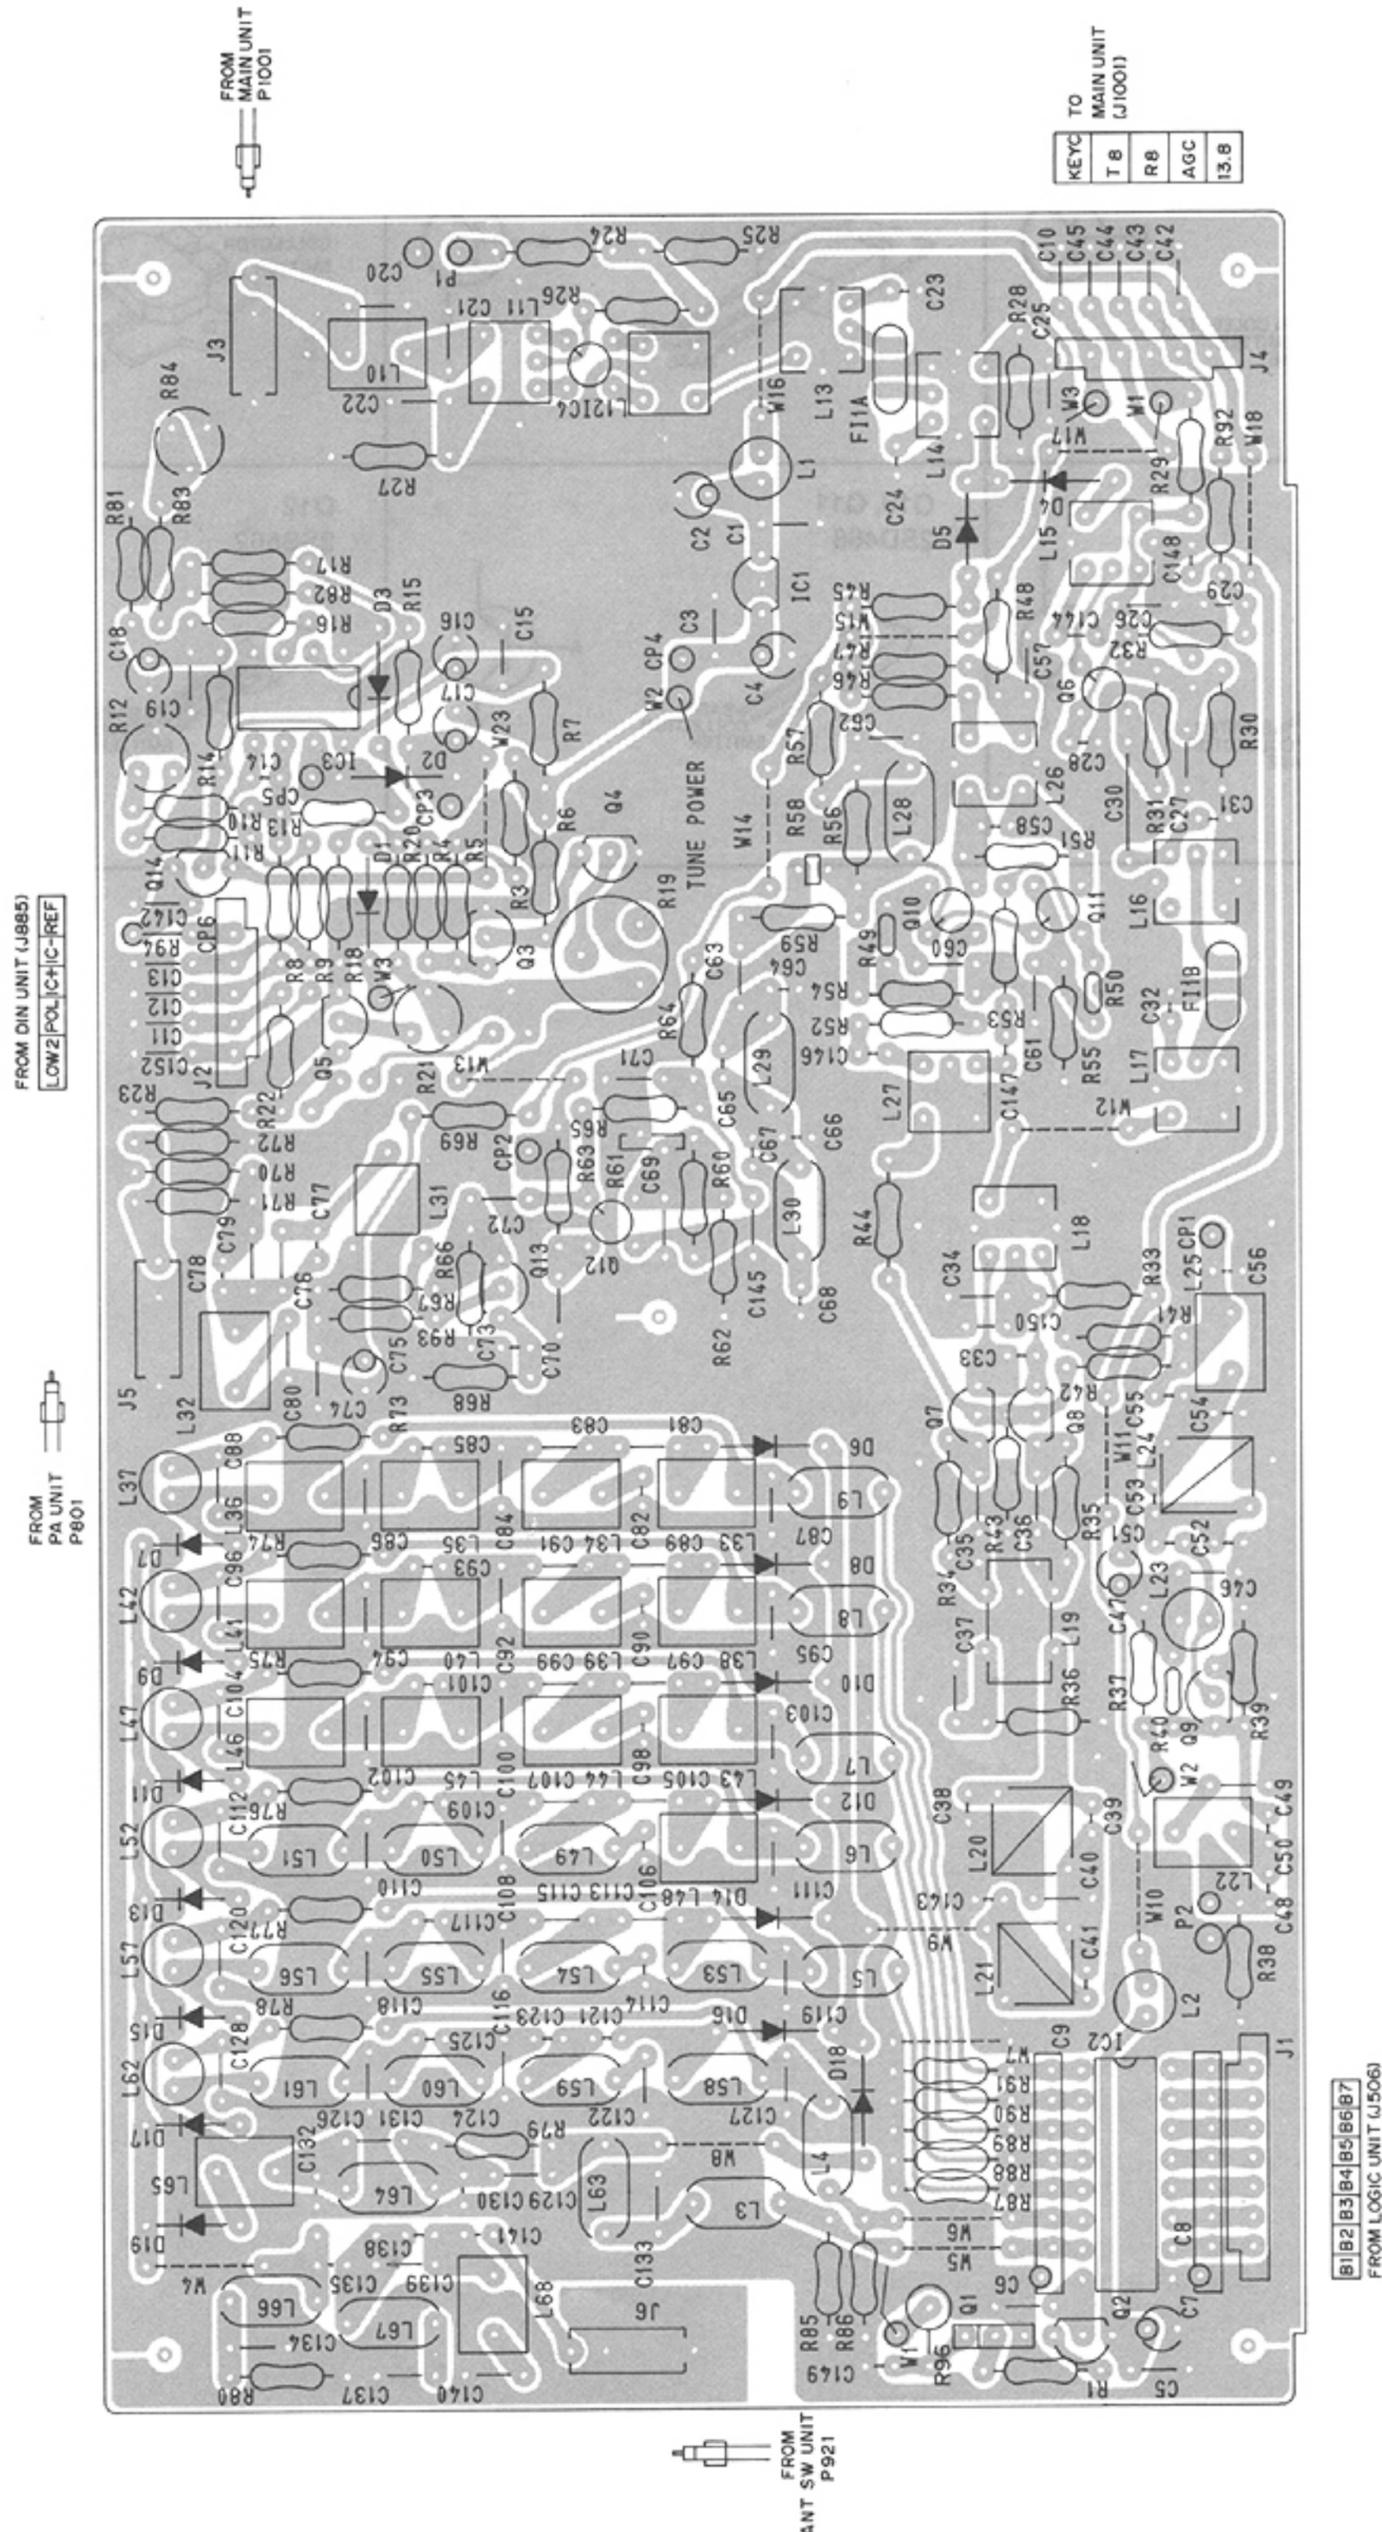

NOTE: Add "500" to the indicated on the unit for actual part number respectively.

8-9 RF UNIT

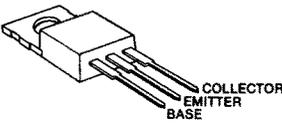

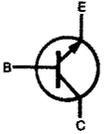

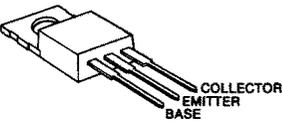

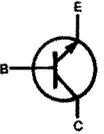

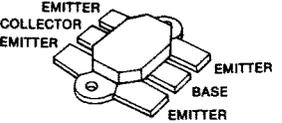

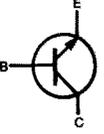

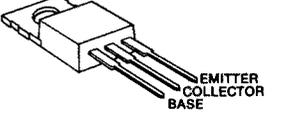

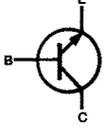

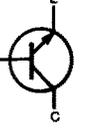

IC					
IC1	$\mu$ A78L82AWC (3-TERMINAL 8V REGULATOR)				
IC2	BA618 (LED DRIVER)				
IC3	NJM4558D (DUAL LOW NOISE AMPLIFIER)				
IC4	ND487C1-3R (DOUBLE-BALANCED MIXER)				
TRANSISTOR					
Q1 2SC3399		Q2 2SB562		Q3, Q4, Q5, Q14 2SC945	
Q6, Q10, Q11, Q12 3SK74		Q7, Q8 2SK125		Q9, Q13 2SC2053	

• RF UNIT

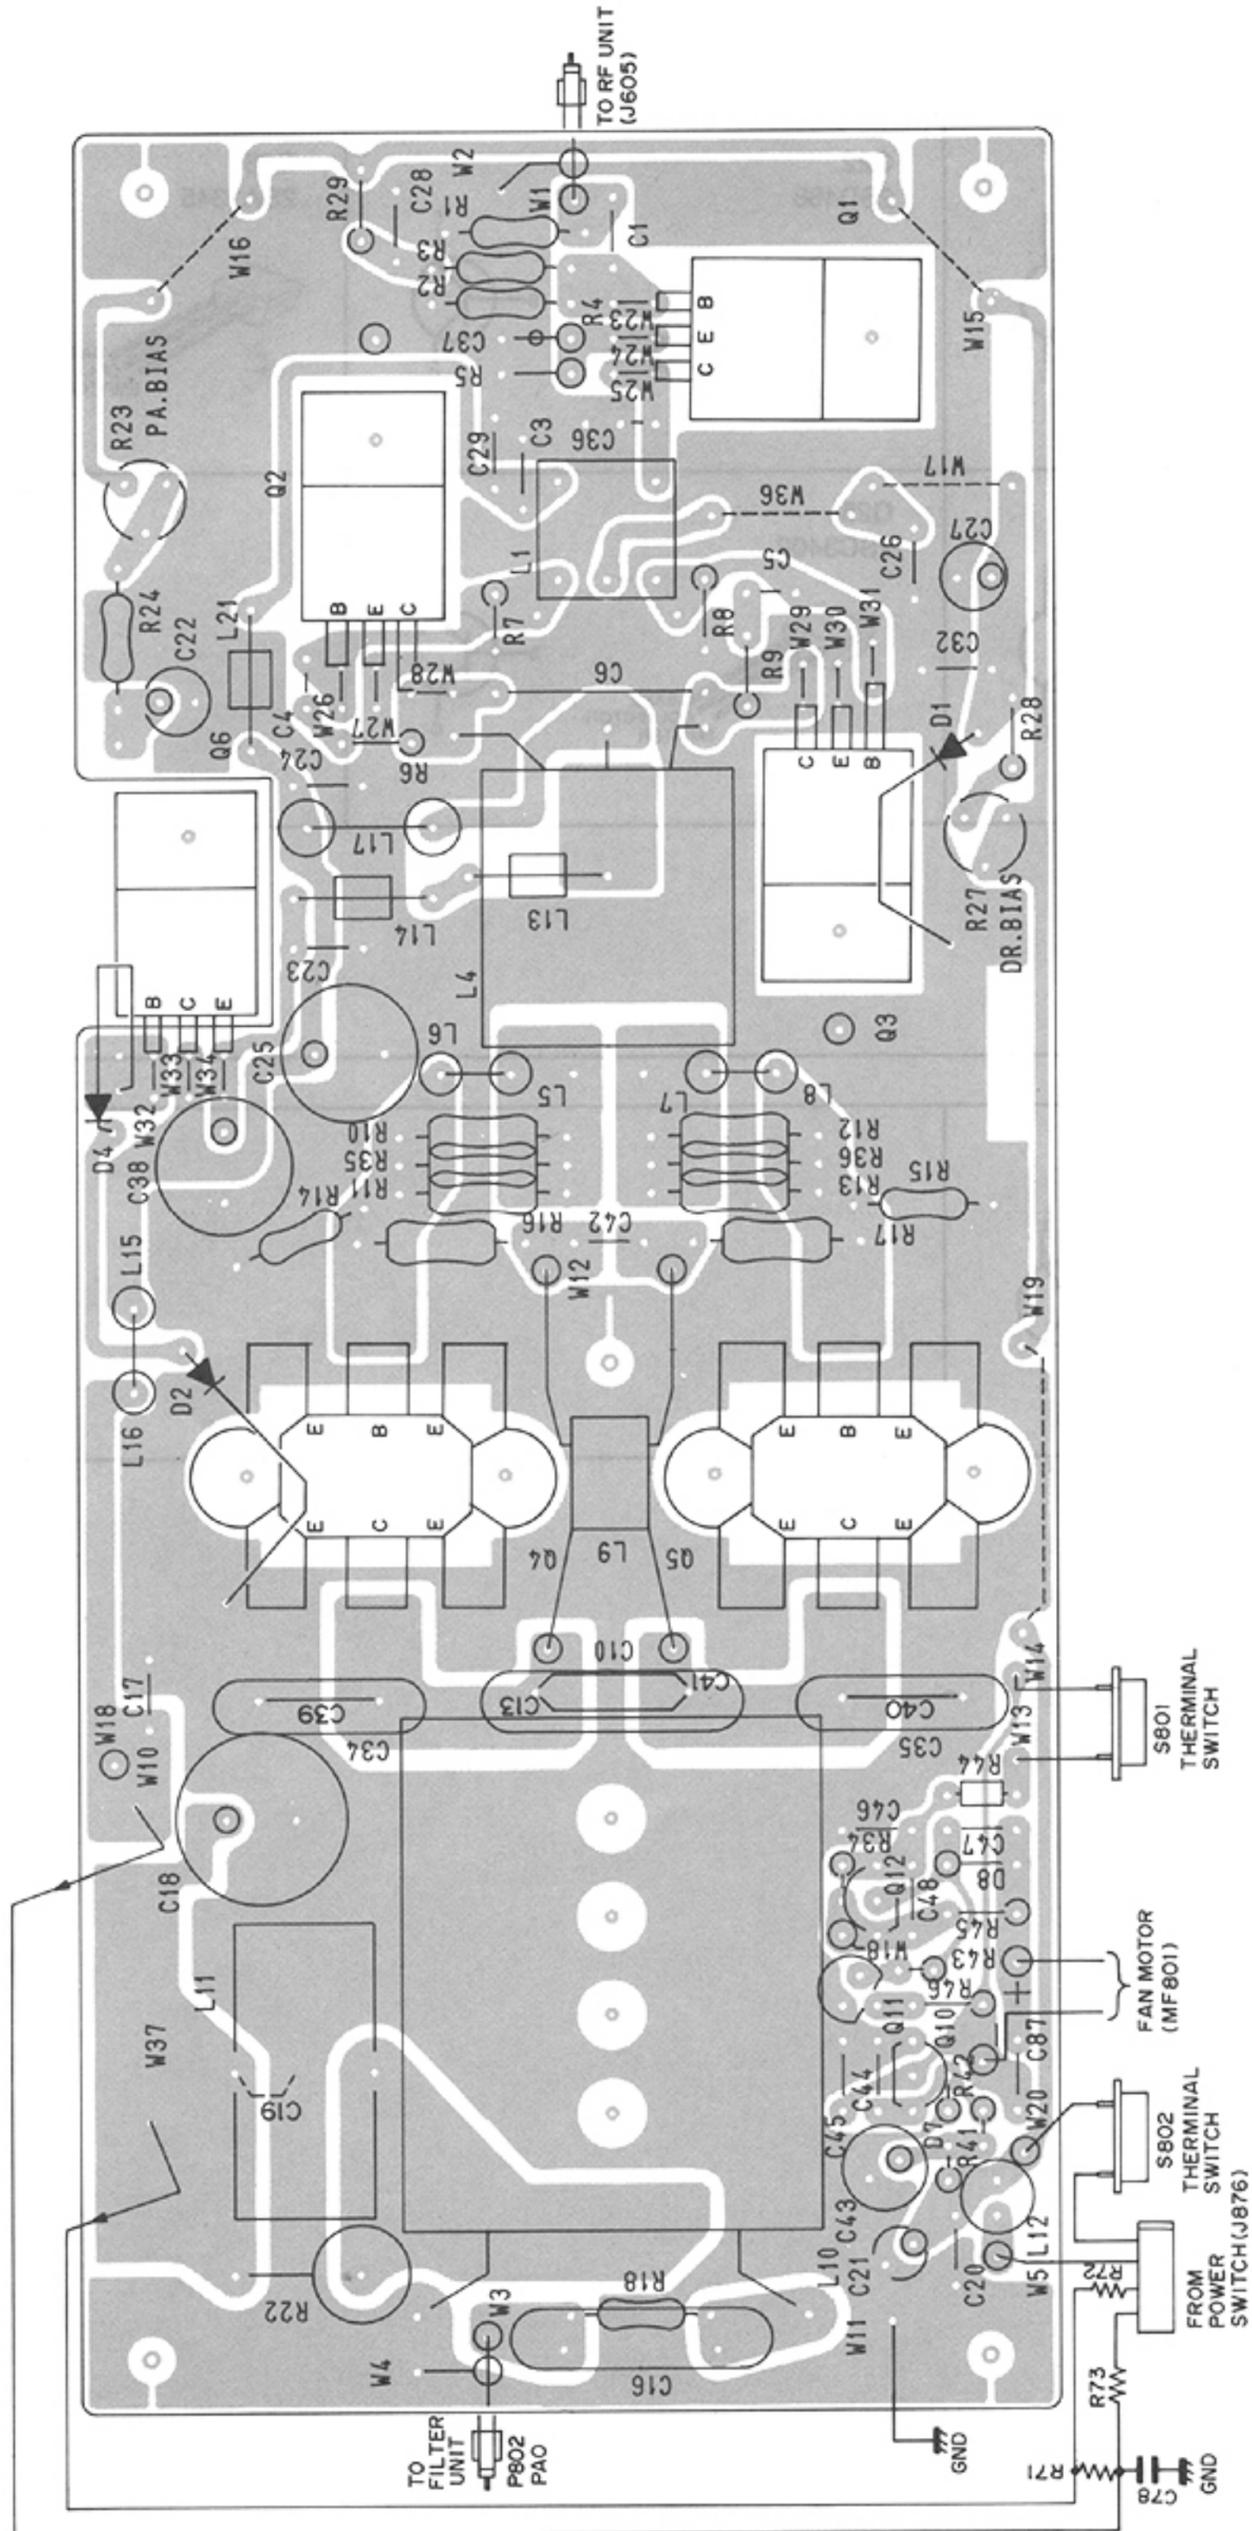

NOTE: Add "600" to the indicated on the unit for actual part number respectively.

8-10 PA UNIT

TRANSISTOR		
<p><b>Q1</b> 2SC1971</p>  	<p><b>Q2, Q3</b> 2SC3133</p>  	<p><b>Q4, Q5</b> 2SC3908</p>  
<p><b>Q6</b> 2SD880</p>  	<p><b>Q10, Q11</b> 2SD468</p>  	<p><b>Q12</b> 2SB562</p>  

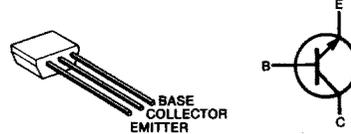

• PA UNIT

NOTE: Add "800" to the indicated on the unit for actual part number respectively.

8-11 OTHER UNITS

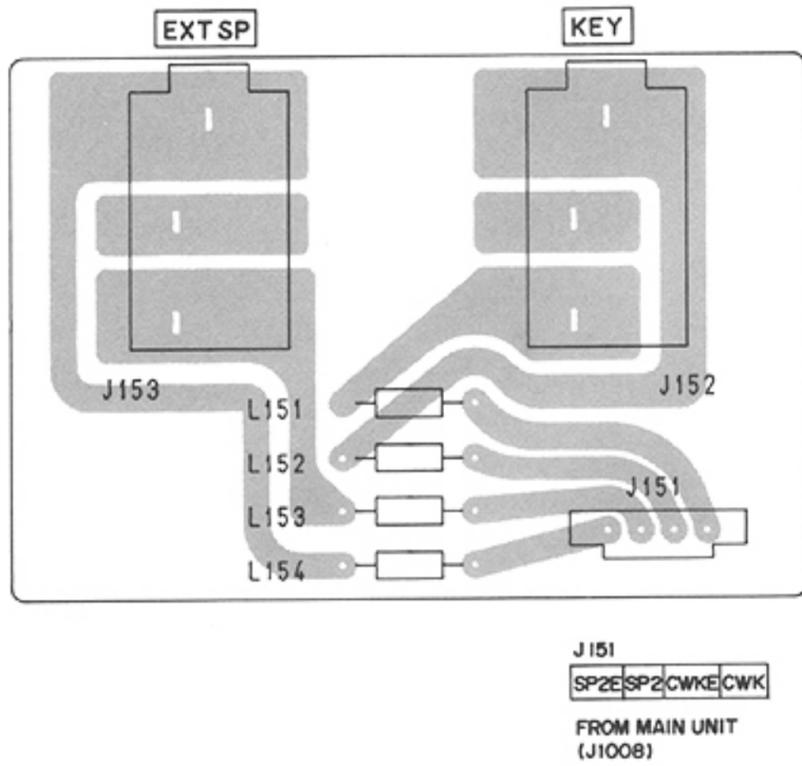

• ANT SW UNIT

TRANSISTOR		
<p>Q21 2SC945</p> 	<p>Q22 2SD468</p> 	<p>Q23 2SA1345</p> 
<p>Q24 2SB562</p> 	<p>Q25 2SC3402</p> 	

• DIN UNIT

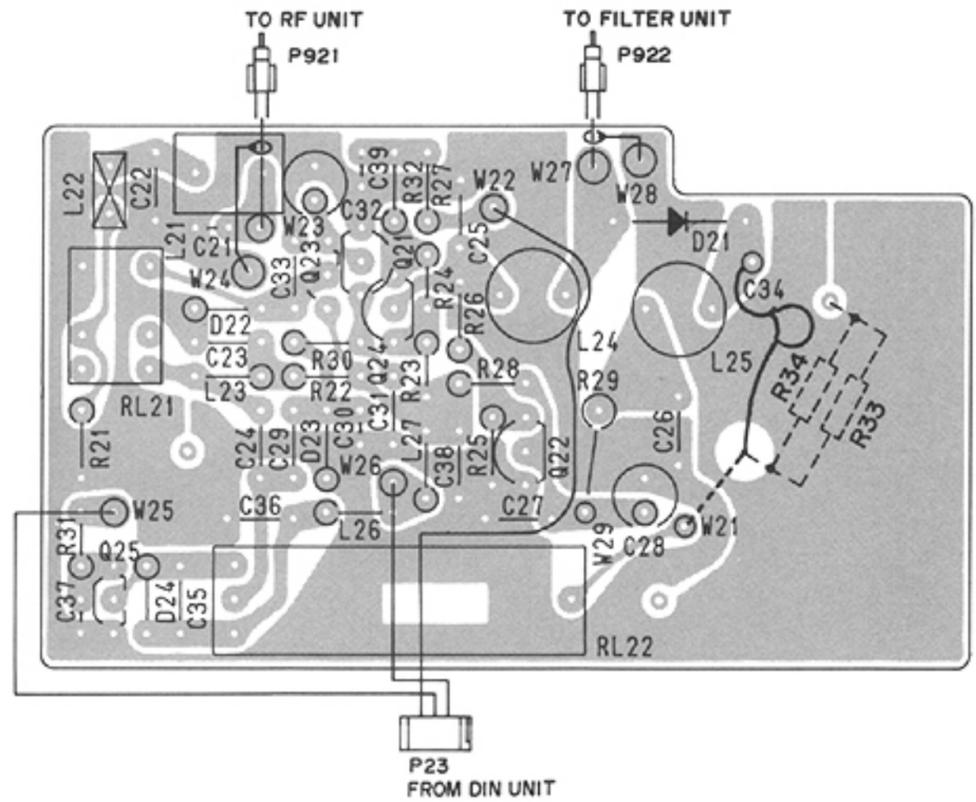

TRANSISTOR	
<p>Q81 2SA1015</p> 	

• JACK UNIT

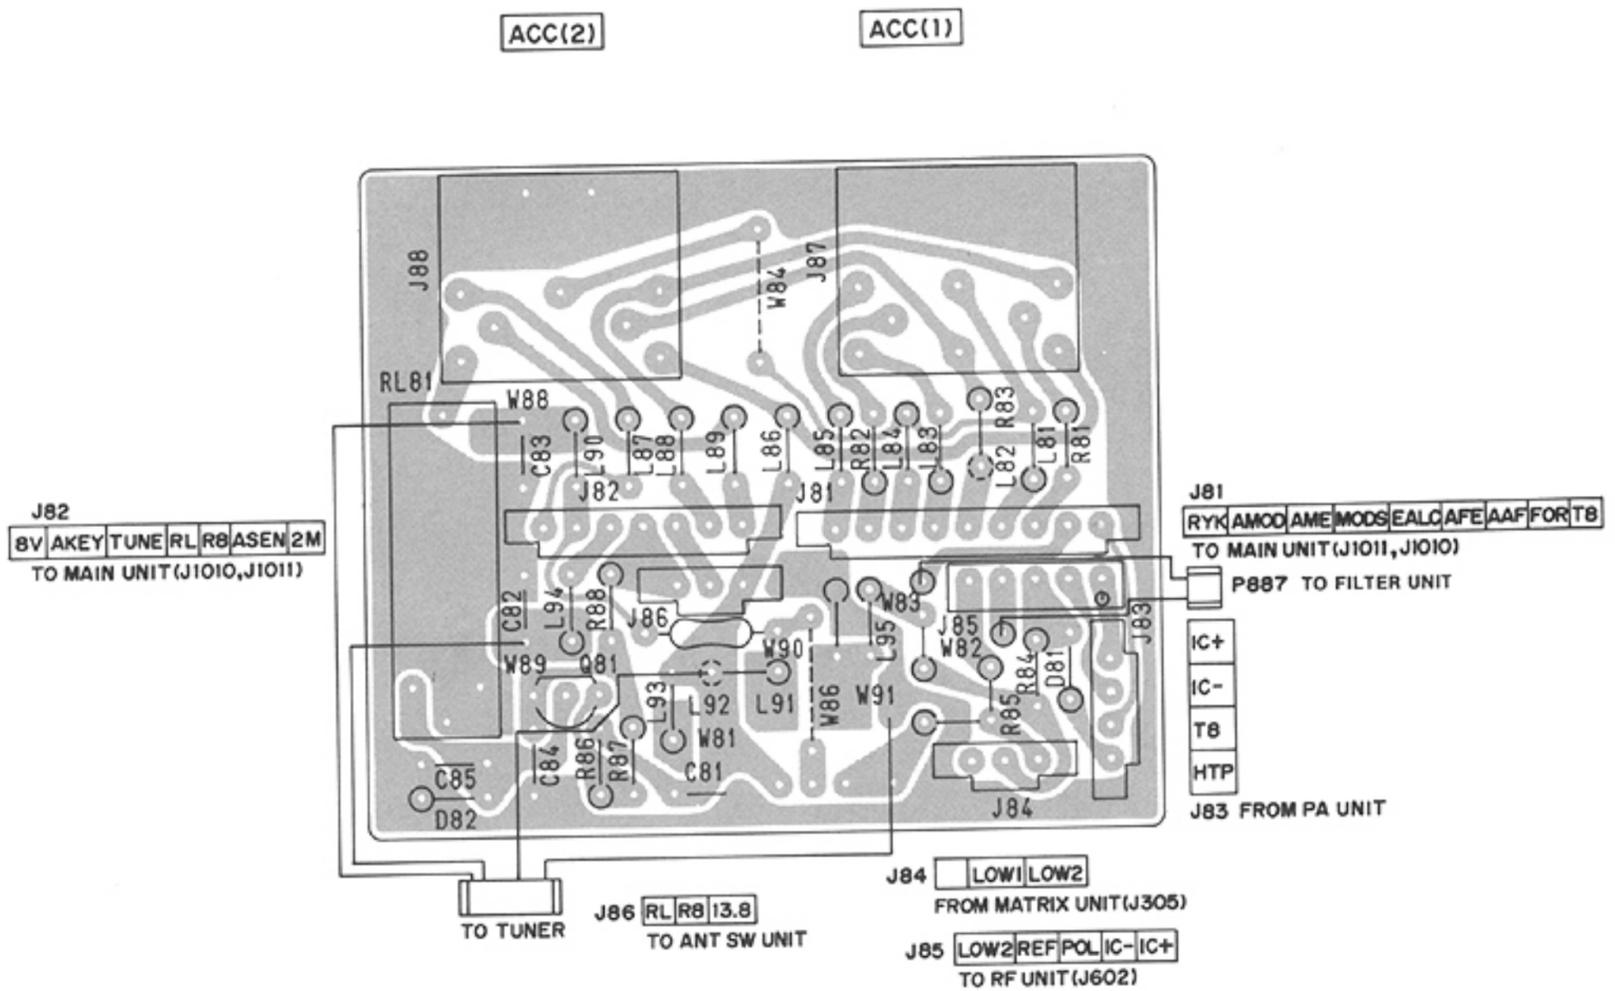

NOTE: Add "800" to the indicated on the unit for actual part number respectively.

• ANT SW UNIT

NOTE: Add "900" to the indicated on the unit for actual part number respectively.

• DIN UNIT

NOTE: Add "800" to the indicated on the unit for actual part number respectively.

## SECTION 9 PARTS LIST

## [FRONT UNIT]
