

**SERVICE  
MANUAL**

144 MHz REPEATER

**IC-RP1520**

---

---

---

---

---

## INTRODUCTION

This service manual describes the latest service information for the **IC-RP1520** 144 MHz REPEATER at the time of publication and covers the following versions:

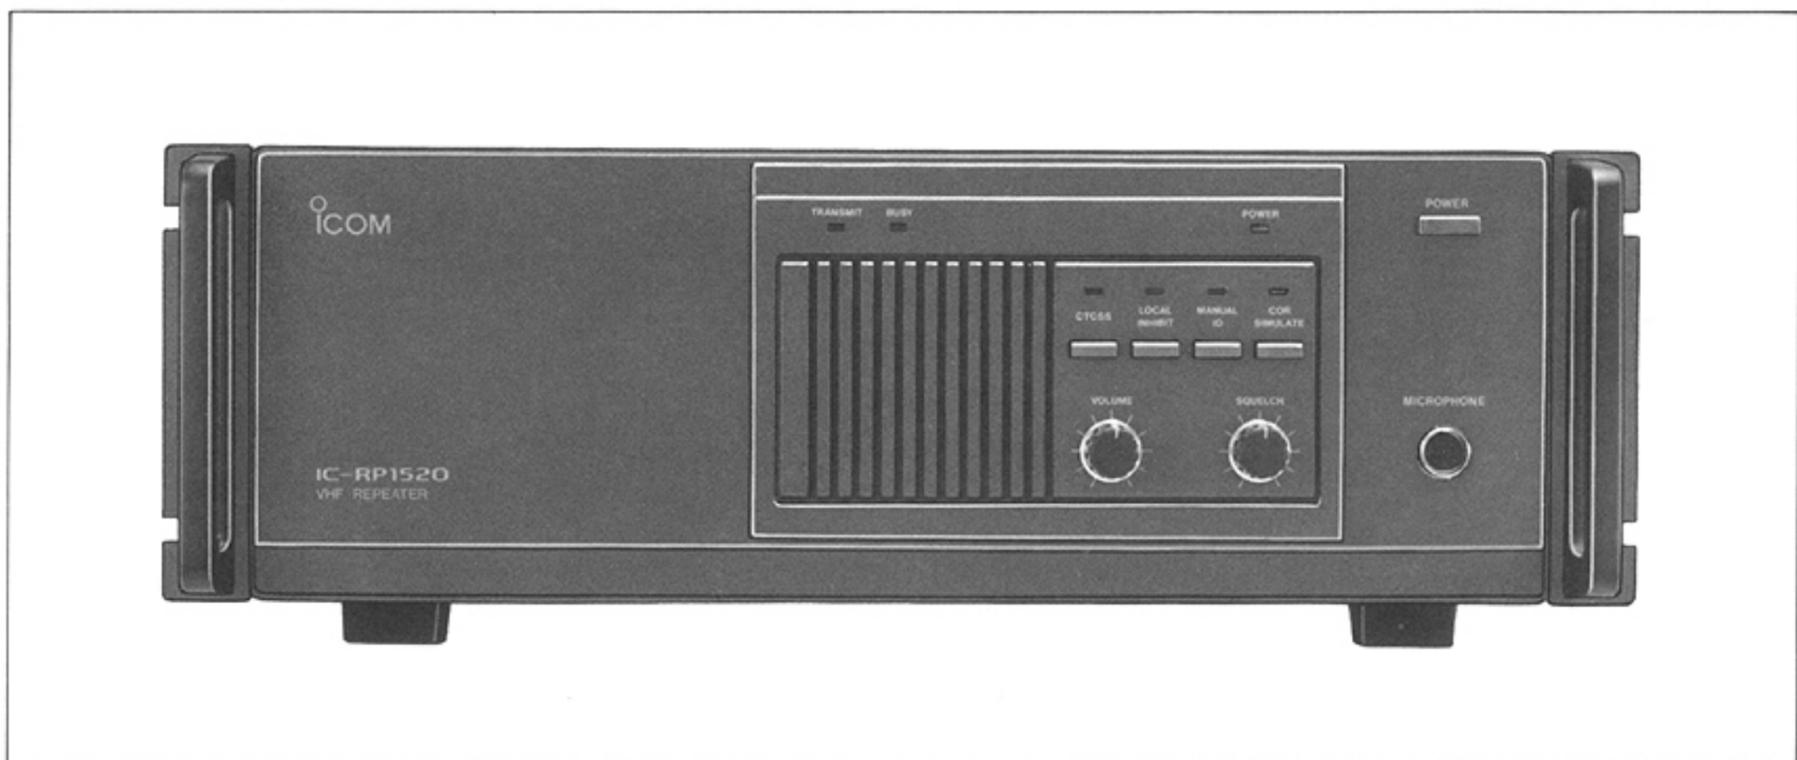

VERSION NO.	VERSION	SYMBOL
#01	U.S.A.	USA
#02	Italy	ITA
#03	Europe	EUR

## DANGER

**NEVER** connect the repeater to a DC backup battery that uses more than 16 V. This will ruin the repeater.

**DO NOT** expose the repeater to rain, snow or any liquids.

**DO NOT** apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the repeater's front end.

## ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

### < SAMPLE ORDER >

1110001000 IC  $\mu$ PC1651G IC-RP1520 TX UNIT 5 pieces  
8810004690 Screw BiH M4 x 5 ZK BS IC-RP1520 Top cover 10 pieces

Addresses are provided on the inside back cover for your convenience.

## REPAIR NOTE

1. Make sure a problem is internal before disassembling the repeater.
2. **DO NOT** open the repeater until the repeater is disconnected from the power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the repeater is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB~50 dB attenuator between the repeater and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the repeater.

## SECTION 1 SPECIFICATIONS

### GENERAL

- Frequency coverage : 144~148 MHz
- Mode : FM (16K0F3E)
- Initial tuning step : 5 or 12.5 kHz (selectable)
- Antenna impedance : 50  $\Omega$  (unbalanced)
- Power supply requirement :
 

VERSION	VOLTAGE
U.S.A.	117 V AC or 13.8 V DC $\pm 15\%$ (negative ground)
Europe	240 V AC or 13.8 V DC $\pm 15\%$ (negative ground)
Italy	220 V AC or 13.8 V DC $\pm 15\%$ (negative ground)
- Power consumption (with AC power) : 160 VA
- Current drain (at 13.8 V DC) :
 

Transmit	8.0 A
Receive squelched	1.0 A
Max. audio output	1.2 A
- Usable temperature range :  $-10\text{ }^{\circ}\text{C}\sim +60\text{ }^{\circ}\text{C}$  ( $+14\text{ }^{\circ}\text{F}\sim +140\text{ }^{\circ}\text{F}$ )
- Frequency stability :  $\pm 0.0001\%$  ( $-10\text{ }^{\circ}\text{C}\sim +60\text{ }^{\circ}\text{C}$ ;  $+14\text{ }^{\circ}\text{F}\sim +140\text{ }^{\circ}\text{F}$ )
- Dimensions : 425 (W)  $\times$  149 (H)  $\times$  368 (D) mm; 16.7 (W)  $\times$  5.9 (H)  $\times$  14.5 (D) in  
(Projections not included)
- Weight : 17 kg (37.5 lb)

### TRANSMITTER

- Output power : 25 W
- Modulation system : Variable reactance frequency modulation
- Max. frequency deviation :  $\pm 5.0$  kHz
- Spurious emissions :  $-60$  dB
- Microphone impedance : 600  $\Omega$

### RECEIVER

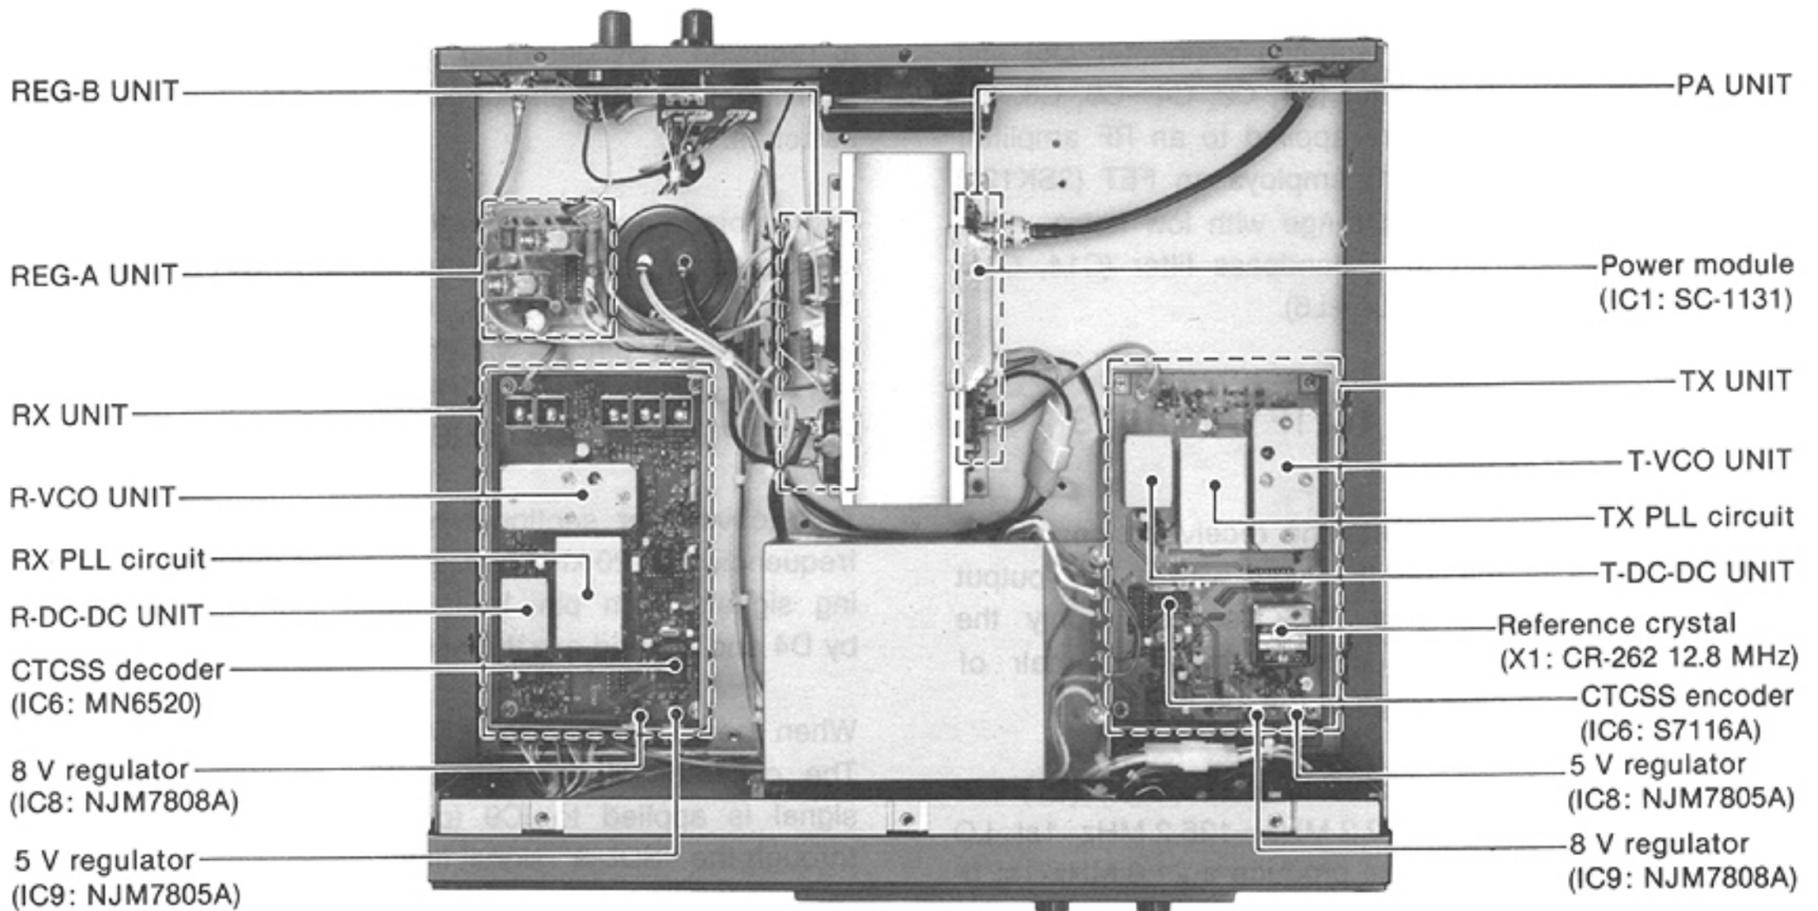

- Receive system : Double-conversion superheterodyne
- Intermediate frequencies :
 

1st	21.8 MHz
2nd	455 kHz
- Sensitivity : 0.5  $\mu\text{V}$  for 12 dB SINAD
- Tight squelch sensitivity : 1.0  $\mu\text{V}$
- Spurious rejection :  $-60$  dB
- Audio output power : 1.7 W at 10 % distortion with an 8  $\Omega$  load
- Audio output impedance : 8  $\Omega$

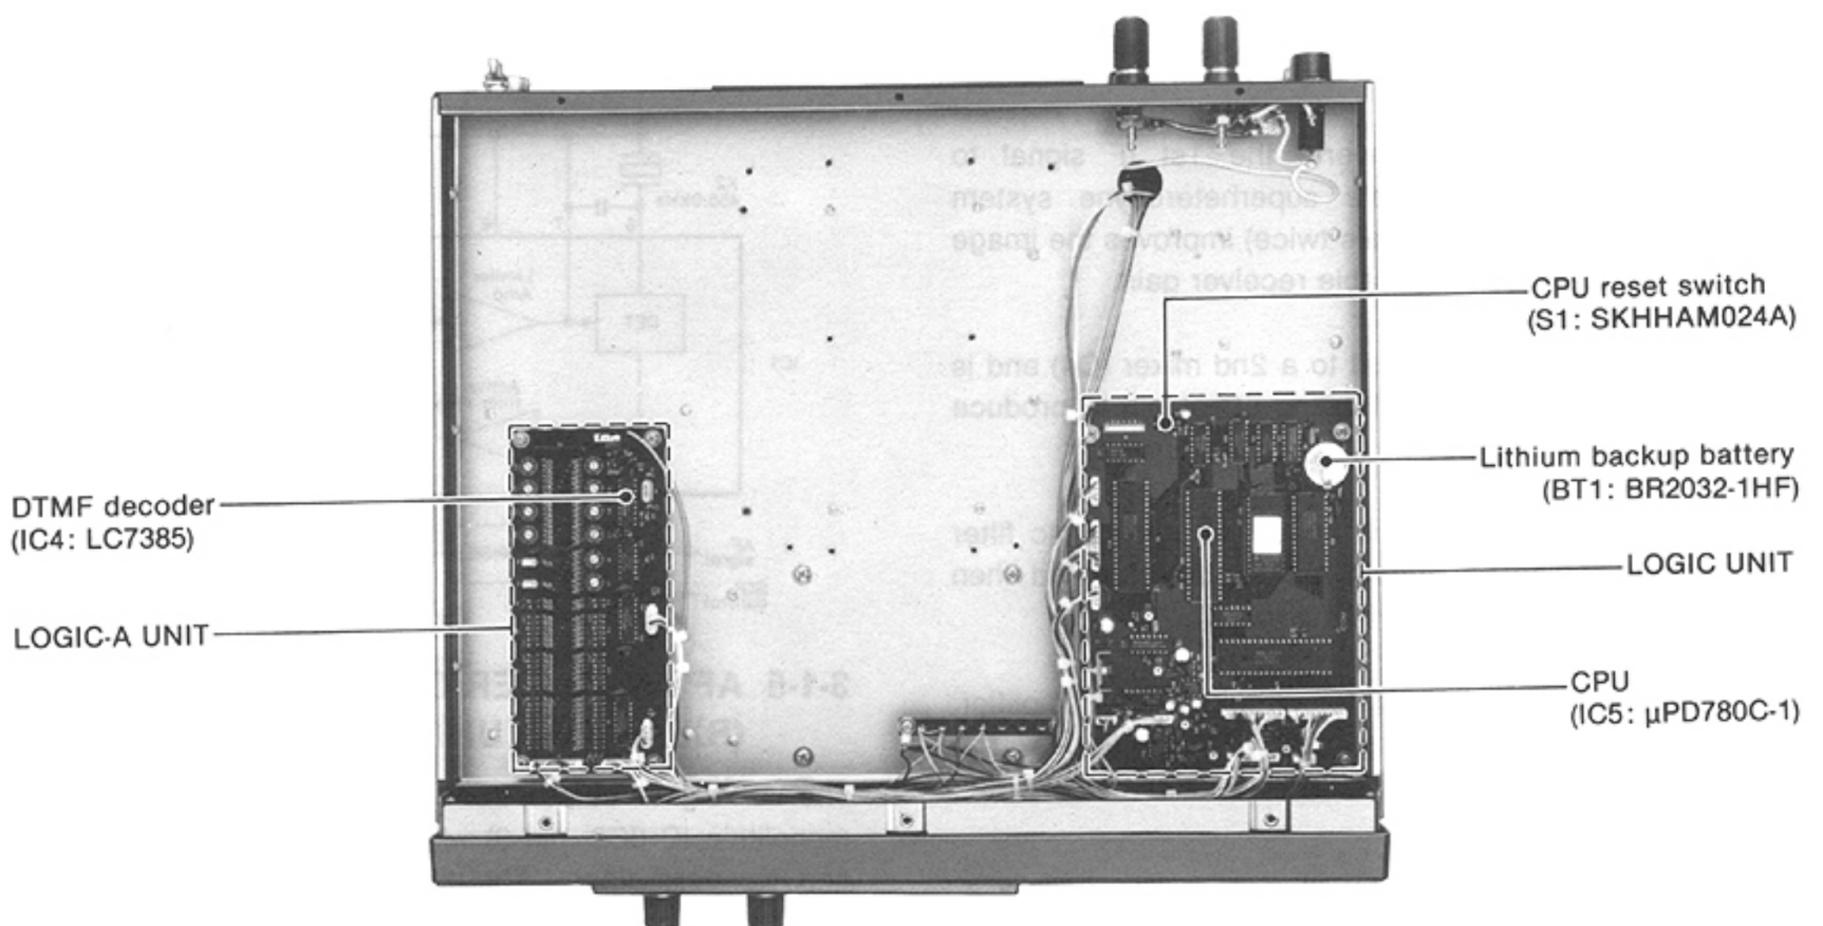

A duplexer is separately required when only one antenna is used for operation.  
All stated specifications are subject to change without notice or obligation.

## SECTION 2 INSIDE VIEWS

### • TOP VIEW

### • BOTTOM VIEW

## SECTION 3 CIRCUIT DESCRIPTION

### 3-1 RECEIVER CIRCUITS

#### 3-1-1 RF CIRCUIT (RX UNIT)

Received signals enter the antenna connector (J6) and pass through a bandpass filter (C1, C2, C4~C6, C8, L1, L2). The filtered signals are applied to an RF amplifier (Q1). The RF amplifier (Q1) employs an FET (3SK121) which expands the dynamic range with low noise. The RF signals are applied to a bandpass filter (C14, C15, C17~C19, C21~C23, C25, L4~L6).

#### 3-1-2 1st MIXER AND 1st IF CIRCUITS (RX UNIT)

The 1st mixer circuit converts the received signals to a fixed frequency of the 1st IF signal with a PLL output frequency. By changing a PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the 1st mixer.

The filtered signals are applied to a 1st mixer (Q2) and are then mixed with a 122.2 MHz~126.2 MHz 1st LO signal from the PLL circuit to produce a 21.8 MHz 1st IF signal.

The 21.8 MHz 1st IF signal is applied to F11. F11 is an MCF (Monolithic Crystal Filter) which suppresses out-of-band signals. The 1st IF signal is applied to a 1st IF amplifier (Q3).

#### 3-1-3 2nd IF AND DEMODULATOR CIRCUITS (RX UNIT)

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The amplified signal is applied to a 2nd mixer (Q4) and is then mixed with a 21.345 MHz 2nd LO signal to produce a 455 kHz 2nd IF signal.

The 455 kHz 2nd IF signal is applied to a ceramic filter (F12) where unwanted signals are suppressed and then to a limiter amplifier section in IC1 (pin 5).

IC1 contains the local oscillator circuit, limiter amplifier, quadrature detector circuit and active filter circuit. The local oscillator section and X1 generate 21.345 MHz for the 2nd LO signal.

The 2nd IF signal from the limiter amplifier (IC1, pin 5) is applied to the quadrature detector section (IC1, pin 8 and ceramic discriminator X2) to demodulate the 2nd IF signal into an AF signal. The AF signal is output from IC1 (pin 9).

#### 3-1-4 SQUELCH CIRCUIT (RX AND LOGIC UNITS)

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switches.

Some noise components in the AF signal from IC1 (pin 9) are applied to an active filter section (IC1, pin 10) via a de-emphasis circuit (R26, C51~C53). This circuit is an integrated circuit with frequency characteristics of -6 dB/octave. The [SQUELCH] control (R2) on the FRONT PANEL adjusts the IC1 (pin 10) input level.

The active filter section amplifies noise components of frequencies of 20 kHz and above and outputs the resulting signals from pin 11. Output signals are rectified by D4 and D5 and are then converted to DC voltage.

When the rectified noise voltage is "HIGH", Q5 turns ON. The collector of Q5 outputs the squelch signal. The signal is applied to IC9 (pin 16) on the LOGIC UNIT through the "SQL-S" signal line.

When the rectified noise voltage is "LOW", Q5 turns OFF. The collector of Q9 outputs the busy signal. The signal is applied to the [BUSY] indicator on the LED UNIT through the "BUSY" signal line. The [BUSY] indicator lights up in green.

#### • 2nd IF AND DEMODULATOR CIRCUITS

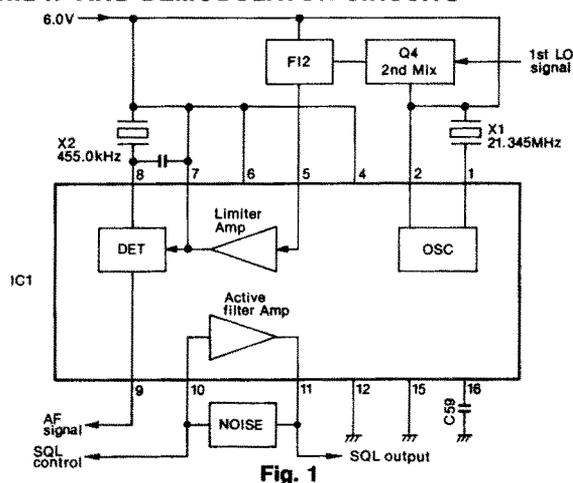

Fig. 1

#### 3-1-5 AF AMPLIFIER CIRCUIT (RX AND AF UNITS)

The AF signal output from IC1 (pin 9) is applied to a monolithic IC (IC2, pin 3) which functions as a high-pass and low-pass filter. The filtered signal is output from IC2 (pin 7) and is then applied to the [VOLUME] control (R1) on the FRONT PANEL through an AF mute switch (Q6). When the squelch is closed, Q6 cuts off the AF signal as an AF mute switch. The AF signal is power-amplified at an AF power amplifier (IC1) on the AF UNIT to drive a speaker.

### 3-2 TRANSMITTER CIRCUITS

#### 3-2-1 MICROPHONE AMPLIFIER CIRCUIT (TX AND T-VCO UNITS)

The AF signal from the microphone is applied to a microphone amplifier (IC10, pin 6). The amplified signal is output from IC10 (pin 7) and applied to IC10 (pin 2) to mix with the "MOD" signal from IC15 on the LOGIC UNIT. The signal is output from IC10 (pin 1) and applied to a limiter (IC7, pin 3). The AF signal obtains +6 dB/octave pre-emphasis at C53 and R51 which are connected to pin 2.

The output signal from IC7 (pin 1) is applied to the splatter filter circuit (IC7, R55, R59, R60, C56, C61, C62) which attenuates components of frequencies of 3 kHz and above. IC7 (pin 7) outputs an "MOD" signal. The "MOD" signal is applied to the T-VCO UNIT.

#### 3-2-2 MODULATION CIRCUIT (T-VCO UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signal.

The "MOD" signal from IC7 (pin 7) changes the reactance of varactor diode (D5) to modulate the oscillated signal at T-VCO (Q1). The oscillated signal is buffer-amplified at Q2 and is then applied to the drive amplifier circuit.

#### 3-2-3 DRIVE AMPLIFIER CIRCUIT (TX AND PA UNITS)

The VCO output is buffer-amplified at IC1 and Q2. The signal is applied to the drive amplifier (Q1) on the PA UNIT. The drive amplifier (Q1) amplifies the signal to obtain 200 mW.

The control voltage from the APC circuit is applied to the collector of Q1 for stable RF output power from a power amplifier (IC1).

#### • APC CIRCUIT

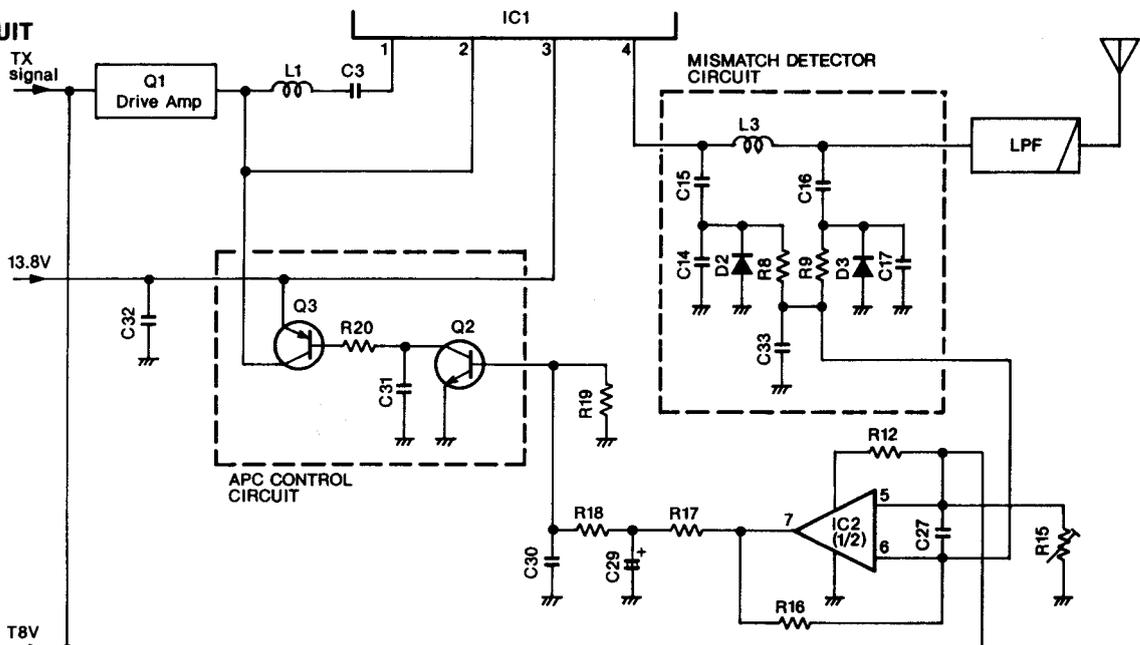

Fig. 2  
3 - 2

#### 3-2-4 RF POWER AMPLIFIER (PA UNIT)

IC1 is a power module which provides a stable 25 W (DC 13.8 V) of output power.

An RF signal from the drive amplifier (Q1) is applied to IC1 (pin 1). The amplified signal is output from IC1 (pin 4) and applied to the antenna connector through the RF detector circuit and low-pass filter circuit.

#### 3-2-5 APC CIRCUIT (PA UNIT)

This circuit controls a current of the power module's first stage and a current of the driver amplifier to obtain stable RF output power.

The APC mismatch detector circuit consists of C14~C17, D2, D3, L3, R8 and R9. When the antenna impedance is matched at 50 Ω, D2 and D3 detect the minimum voltage. The detected voltage is applied to a differential amplifier (IC2, pin 6). The APC reference voltage is applied to IC2 (pin 5).

When the antenna impedance is mismatched, the voltage in pin 6 of IC2 exceeds the reference voltage in pin 5 of IC2. The output level from IC2 (pin 7) decreases. Q2 amplifies the current from the differential amplifier (IC2) which controls Q3. Q3 changes the supply voltage to Q1 and IC1.

This decreases the output power from the drive amplifier (Q1) and power amplifier (IC1) until the input voltage in pin 6 of IC2 reaches the same level as pin 5 of IC2.

### 3-3 PLL CIRCUITS

#### 3-3-1 GENERAL

Each receiver and transmitter circuit has an independent PLL circuit for controlling frequencies. All PLL circuits are shielded and installed on the RX and TX UNITS.

PLL circuits steadily oscillate the transmit frequency and the receive local frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

#### 3-3-2 RECEIVER PLL CIRCUIT (RX UNIT)

The PLL circuit, using a PLL IC (IC3) and dual modulus prescaler (IC4) on the RX UNIT, generates the 1st LO frequency with a Colpitts VCO (Q1) on the R-VCO UNIT. The PLL IC sets the dividing ratio based on serial data from the CPU and controls the dual modulus prescaler. The PLL IC compares the phases of a VCO signal with the reference oscillator frequency and detects the out-of-step phase. Then, the VCO signal is output from the PLL IC (pin 16 and 17).

#### 3-3-3 RECEIVER REFERENCE OSCILLATOR CIRCUIT (RX AND TX UNITS)

A 12.8 MHz reference frequency is produced by the oscillator (X1) on the TX UNIT. The frequency is adjusted with R24. The reference frequency is buffer-amplified at Q5 and applied to the PLL IC (IC3, pin 2) on the RX UNIT.

#### 3-3-4 RECEIVER LOOP FILTER AND DC-DC CONVERTER CIRCUITS (RX AND R-DC-DC UNITS)

Phase-detected signals from IC3 (pin 16 and 17) are converted to DC voltage by a loop filter consisting of an active filter (Q10, Q11).

The frequency at which the VCO oscillates is controlled by varactor diodes (D1~D4) on the R-VCO UNIT. DC voltage (PLL lock voltage) is provided through the integrator circuit (R32, C110).

The DC-DC converter circuit (IC1 and Q1) on the R-DC-DC UNIT creates approximately 20 V DC from 5V DC to obtain wide range lock voltages for the PLL circuits.

#### 3-3-5 RECEIVER VCO CIRCUIT (R-VCO UNIT)

The VCO circuit (Q1, D1~D4) generates the receive frequency. Strip lines are used for stable oscillation over a wide frequency range. Varactor diodes (D1~D4) provide frequency control. The buffer amplifier (Q2) amplifies VCO oscillation having no effect on the latter circuit. The signal is divided by 64 or 65 in the dual modulus prescaler (IC4). The phase-divided signal is output from IC4 (pin 5) and applied to the PLL IC (IC3, pin 6).

#### • PLL CIRCUITS

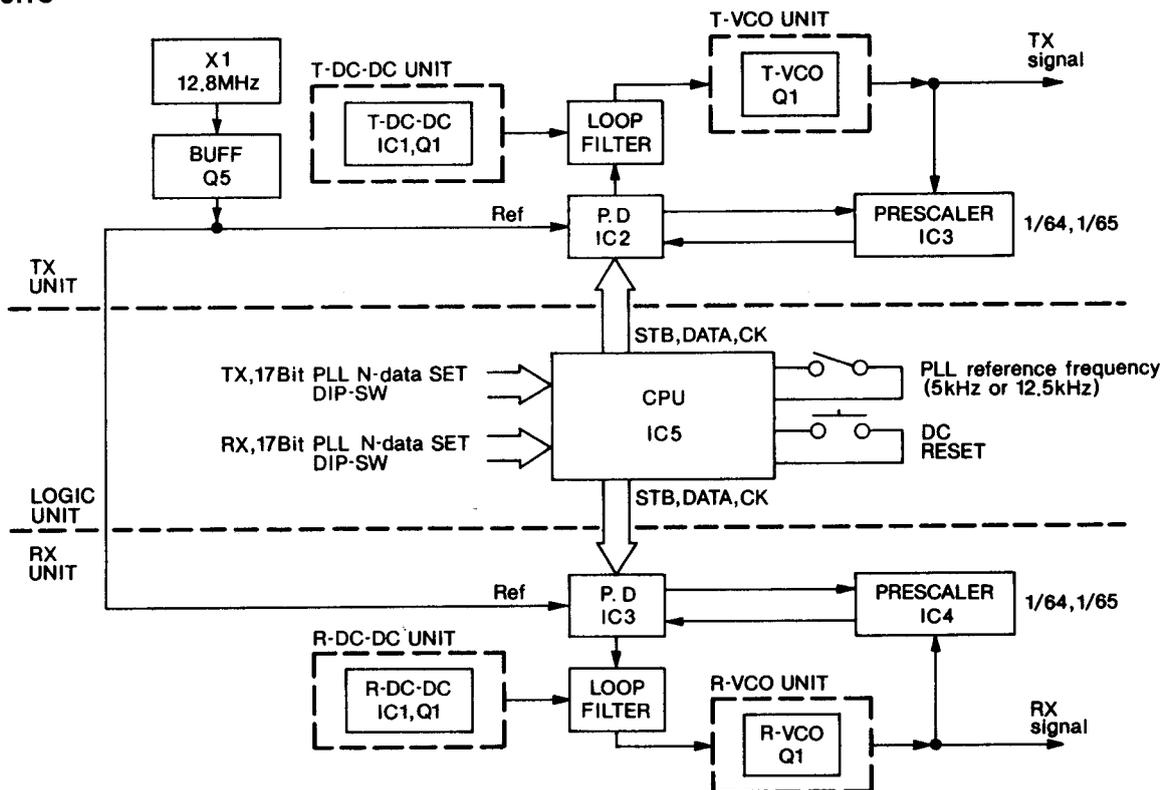

Fig. 3

### 3-3-6 RECEIVER UNLOCK SENSOR CIRCUIT (RX AND LOGIC UNITS)

When the PLL circuit is unlocked, IC3 (pin 13) becomes "HIGH". The "HIGH" signal is applied to IC9 (pin 14) as an unlock signal on the LOGIC UNIT.

### 3-3-7 TRANSMITTER PLL CIRCUIT (TX UNIT)

The PLL circuit, using a PLL IC (IC2) and dual modulus prescaler (IC3) on the TX UNIT, generates the transmit frequency with a Colpitts VCO (Q1) on the T-VCO UNIT. The PLL IC sets the dividing ratio based on serial data from the CPU and controls the dual modulus prescaler. The PLL IC compares the phases of a VCO signal with the reference oscillator frequency and detects the out-of-step phase. Then, the VCO signal is output from the PLL IC (pin 16 and 17).

### 3-3-8 TRANSMITTER REFERENCE OSCILLATOR CIRCUIT (TX UNIT)

A 12.8 MHz reference frequency is produced by the oscillator (X1). The frequency is adjusted with R24. The reference frequency is buffer-amplified at Q5 and applied to the PLL IC (IC2, pin 2).

### 3-3-9 TRANSMITTER LOOP FILTER AND DC-DC CONVERTER CIRCUITS (TX AND T-DC-DC UNITS)

Phase-detected signals from IC2 (pin 16 and 17) are converted to DC voltage by a loop filter consisting of an active filter (Q3, Q4).

The frequency at which the VCO oscillates is controlled by varactor diodes (D1~D4) on the T-VCO UNIT. DC voltage (PLL lock voltage) is provided through the integrator circuit (R15, C70).

The DC-DC converter circuit (IC1 and Q1) on the T-DC-DC UNIT creates approximately 20 V DC from 5 V DC to obtain wide range lock voltages for the PLL circuits.

### 3-3-10 TRANSMITTER VCO CIRCUIT (T-VCO UNIT)

The VCO circuit (Q1, D1~D4) generates the transmit frequency and produces FM modulation. Strip lines are used for stable oscillation over a wide frequency range. Varactor diodes (D1~D4) provide frequency control. The buffer amplifier (Q2) amplifies VCO oscillation having no effect on the latter circuit. The signal is divided by 64 or 65 in the dual modulus prescaler (IC3). The phase-divided signal is output from IC3 (pin 5) and applied to the PLL IC (IC2, pin 6).

### 3-3-11 TRANSCEIVER UNLOCK SENSOR CIRCUIT (TX AND LOGIC UNITS)

When the PLL circuit is unlocked, IC2 (pin 13) becomes "HIGH". The "HIGH" signal is applied to IC9 (pin 15) as an unlock signal on the LOGIC UNIT.

### 3-4 DTMF DECODER CIRCUIT (LOGIC-A UNIT)

AF signals from the RX UNIT are fed to Q1 on the LOGIC-A UNIT through J5 and signals are amplified.

IC4 is an IC chip for the DTMF detector. An applied double-tone signal is detected at IC4 and outputs signals as a 4-bit binary code.

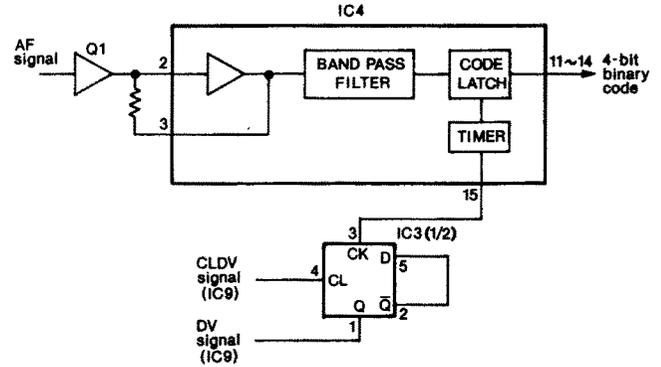

Fig. 4

### 3-5 REGULATOR CIRCUITS

The DC voltages are supplied from regulator circuits corresponding to the voltages. They are regulated at the following circuits using 13.8 V DC.

#### (1) 5 V REGULATOR (RX, TX, AND LOGIC UNITS)

5 V DC are regulated by the following three-terminal voltage regulators.

REGULATOR	IC8	IC9	IC16
UNIT	TX	RX	LOGIC

#### (2) 8 V regulator (RX AND TX UNITS)

8 V DC are regulated by the three-terminal voltage regulator.

#### • REGULATOR CIRCUITS

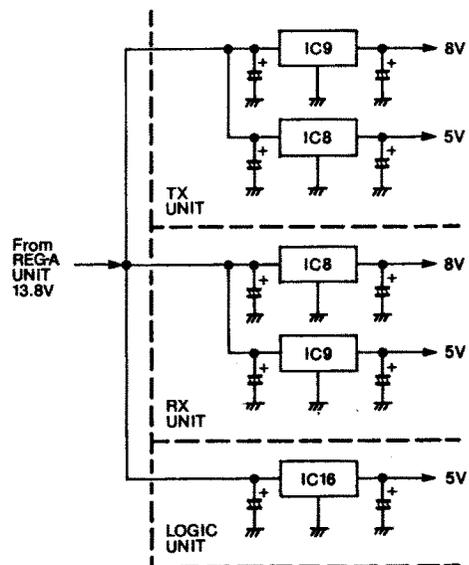

Fig. 5

### 3-6 OTHER CIRCUITS

#### 3-6-1 CTCSS DECODER CIRCUIT (RX UNIT)

IC6 contains a CTCSS tone encoder/decoder, an AF amplifier circuit, and a two-stage AF filter. The encoder is not used in this circuit.

The AF signal from IC1 (pin 9) is applied to Q12. Q12 is an active filter which functions as a low-pass filter. The filtered signals are applied to a programmable CTCSS tone decoder (IC6, pin 29) which decodes 67.0 Hz ~250.3 Hz tone frequencies. The tone frequency is set by the dip switches (S3) on the LOGIC-A UNIT.

The AF signal from IC6 (pin 29) is applied to the AF amplifier circuit and then to the two-stage AF filter. The filtered signal is output as a tone squelch signal from IC6 (pin 23). The tone squelch signal is applied to IC9 (pin 17) on the LOGIC UNIT through the "T-SQL" signal line.

IC7 functions as a serial/parallel converter and supplies 8-bit parallel data to IC6 (pin 3~6). The following table shows the relation between the input data and output frequency from IC6.

• CTCSS TONE DECODER FREQUENCY TABLE

TONE NUMBER	TONE FREQUENCY (Hz)	S3						TONE NUMBER	TONE FREQUENCY (Hz)	S3						TONE NUMBER	TONE FREQUENCY (Hz)	S3

#### 3-6-2 CTCSS ENCODER CIRCUIT (TX UNIT)

The CTCSS encoder (IC6) encodes 67.0 Hz~250.3 Hz tone frequencies which are set by the dip switches (S11) on the LOGIC-A UNIT. The tone frequency is output from IC6 (pin 1) and then applied to R32 for the deviation adjustment.

IC5 functions as a serial/parallel converter and supplies 8-bit parallel data to IC6. The following table shows the relation between input data and the output frequency from IC6.

• CTCSS TONE ENCODER FREQUENCY TABLE

TONE NUMBER	TONE FREQUENCY (Hz)	S11						TONE NUMBER	TONE FREQUENCY (Hz)	S11						TONE NUMBER	TONE FREQUENCY (Hz)	S11

## SECTION 6 ADJUSTMENT PROCEDURES

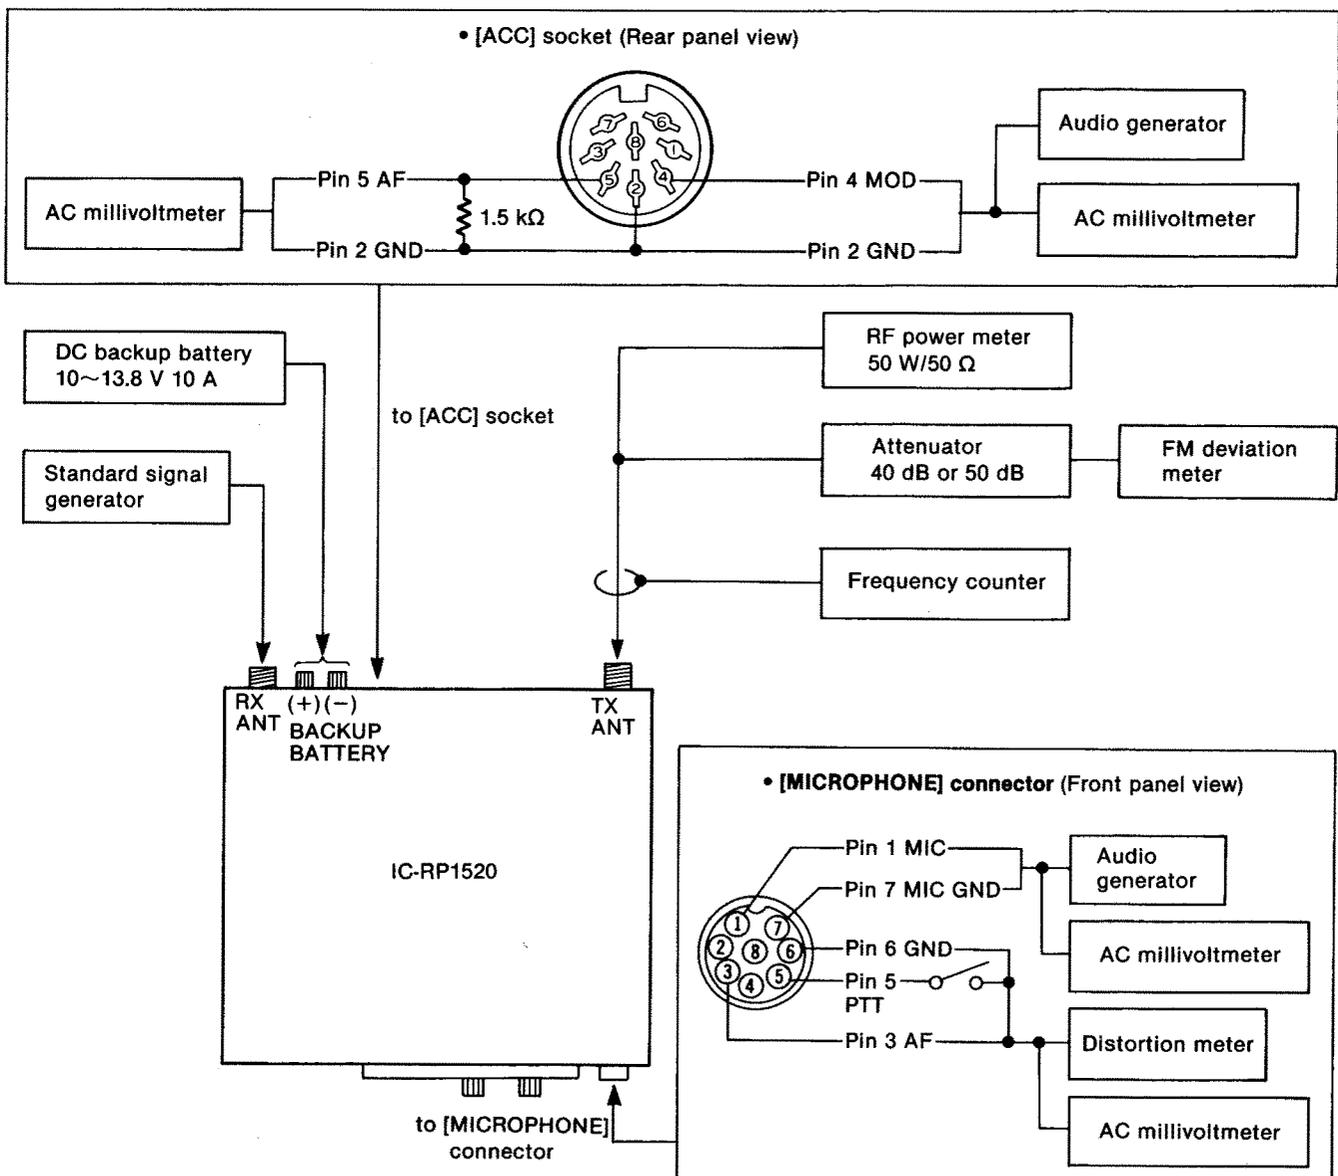

### 6-1 PREPARATION BEFORE SERVICING

#### ■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC backup battery	Output voltage : 10~13.8 V DC Current capacity : 10A or more	AC millivoltmeter	Measuring range : 10 mV~3 V
RF power meter (terminated type)	Measuring range : 1~50 W Frequency range : 130~200 MHz Impedance : 50 Ω SWR : Less than 1.2: 1	Audio generator	Frequency range : 200~3000 Hz Output level : 1~300 mV
Frequency counter	Frequency range : 0.1~200 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	Attenuator	Power attenuation : 40 or 50 dB Capacity : 60 W or more
Oscilloscope	Frequency range : DC~20 MHz Measuring range : 0.01~10 V	Distortion meter	Frequency range : 1 kHz±10 Hz Measuring range : 1~20 %
Standard signal generator (SSG)	Frequency range : 0.1~200 MHz Output level : -127~-17 dBm (0.1 μV~32 mV)	FM deviation meter	Frequency minimum : 200 MHz Measuring range : 0~±10 kHz
		DC voltmeter	Input impedance : 50 kΩ/DC or better

CW: Clockwise CCW: Counterclockwise

#### ■ CONNECTION

## 6-2 RX PLL ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
LOCK VOLTAGE	1	RX	Connect the DC voltmeter to R32. (Q11 Collector side)	3.0 V	RX (R-VCO)	C1
	2					

### • Example of setting N-data for receiving

Receive frequency : 144.000 MHz  
 1st IF frequency : 21.800 MHz (fixed)  
 PLL reference frequency : 0.005 MHz (5 kHz)

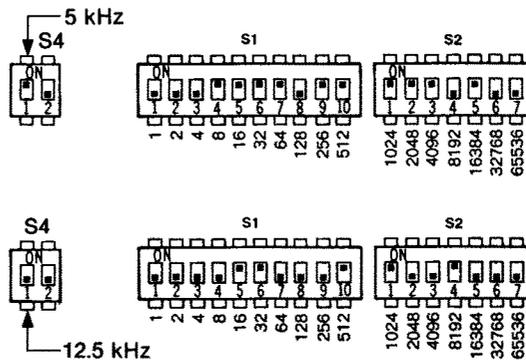

$$\begin{aligned} \text{N-data for receiving} &= \frac{\text{receive frequency} - \text{1st IF frequency}}{\text{PLL reference frequency}} \\ &= \frac{144.000 - 21.8}{0.005} \\ &= 24440 \end{aligned}$$

Receive frequency : 144.000 MHz  
 1st IF frequency : 21.800 MHz (fixed)  
 PLL reference frequency : 0.0125 MHz (12.5 kHz)

$$\begin{aligned} \text{N-data for receiving} &= \frac{\text{receive frequency} - \text{1st IF frequency}}{\text{PLL reference frequency}} \\ &= \frac{144.000 - 21.8}{0.0125} \\ &= 9776 \end{aligned}$$

Set the dip switches (S1, S2) to the values equivalent to the obtained N-data.

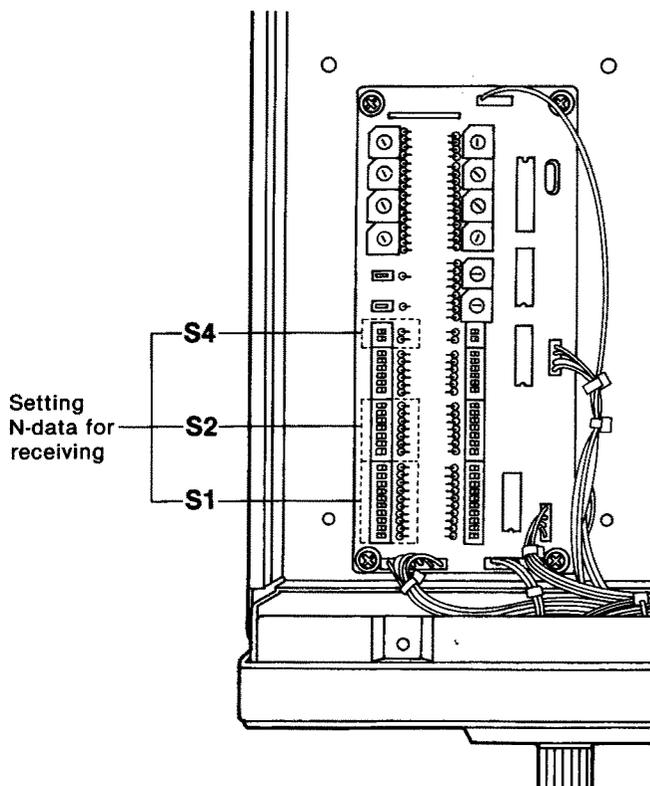

Example of setting the dip switches.

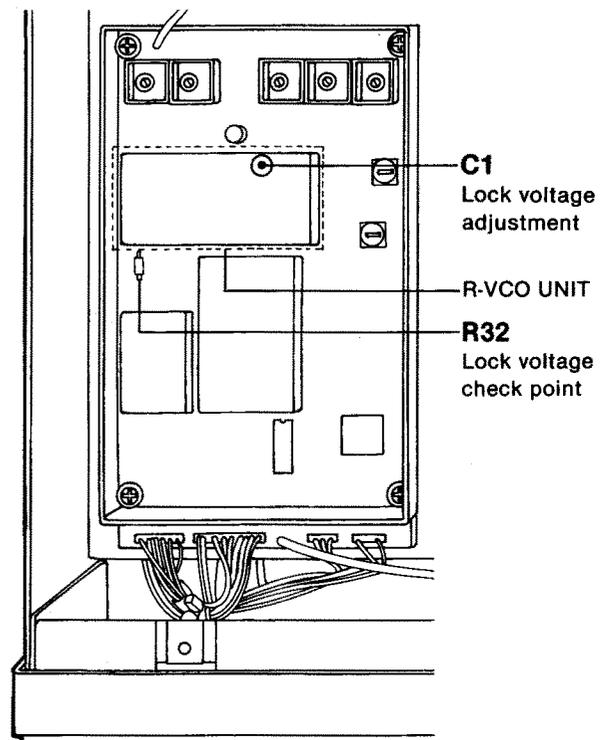

Dip switches	N-data value
S2-5	→ 16384
S2-3	→ 4096
S2-2	→ 2048
S2-1	→ 1024
S1-10	→ 512
S1-9	→ 256
S1-7	→ 64
S1-6	→ 32
S1-5	→ 16
S1-4	→ 8 (+)
<b>Total</b>	<b>24440</b>

Dip switches	N-data value
S2-4	→ 8192
S2-1	→ 1024
S1-10	→ 512
S1-6	→ 32
S1-5	→ 16 (+)
<b>Total</b>	<b>9776</b>

### • LOGIC-A UNIT

### • RX UNIT

### 6-3 TX PLL ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
LOCK VOLTAGE	1 <ul style="list-style-type: none"> <li>Set the transmit frequency (See below): 144.000 MHz</li> <li>Connect the RF power meter or a 50 Ω dummy load to the [TX ANT] connector.</li> <li>Transmitting</li> </ul>	TX	Connect the DC voltmeter to R15.	7.5 V	TX (T-VCO)	C1
REFERENCE FREQUENCY	1 <ul style="list-style-type: none"> <li>Set the transmit frequency (See below): 144.000 MHz</li> <li>Connect the RF power meter or a 50 Ω dummy load to the [TX ANT] connector.</li> <li>Transmitting</li> </ul>	Rear panel	Loosely couple the frequency counter to the [TX ANT] connector.	144,000,000 Hz	TX	R24
	2	After adjustment, program the identification frequency.				

• Example of setting N-data for transmitting

Transmit frequency : 144.000 MHz  
 PLL reference frequency : 0.005 MHz (5 kHz)

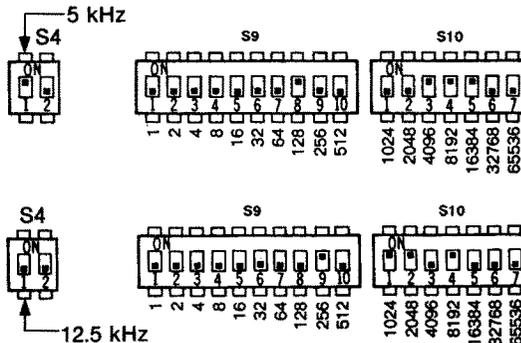

$$N\text{-data for transmitting} = \frac{\text{transmit frequency}}{\text{PLL reference frequency}} = \frac{144.000}{0.005} = 28800$$

Transmit frequency : 144.000 MHz  
 PLL reference frequency : 0.0125 MHz (12.5 kHz)

$$N\text{-data for transmitting} = \frac{\text{transmit frequency}}{\text{PLL reference frequency}} = \frac{144.000}{0.0125} = 11520$$

Set the dip switches (S9, S10) to the values equivalent to the obtained N-data.

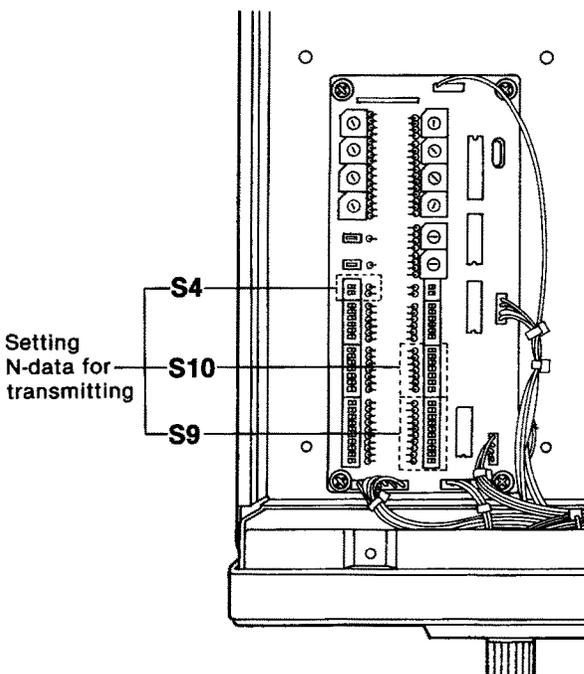

Example of setting the dip switches.

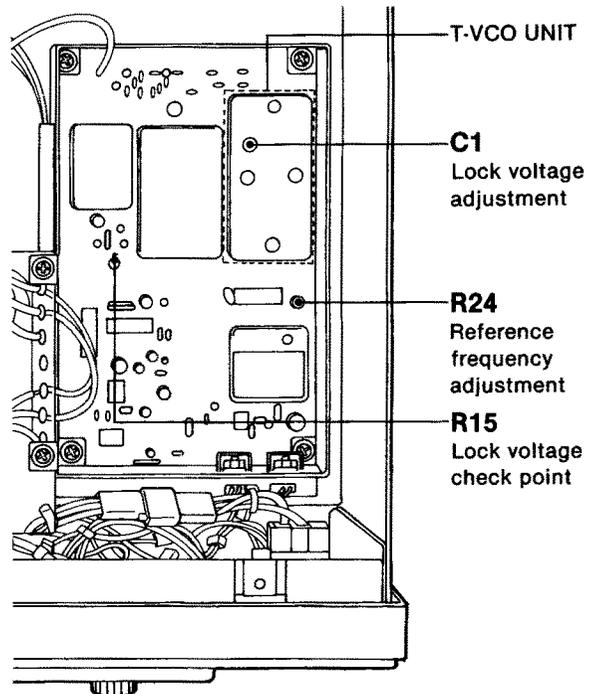

Dip switches	N-data value
S10-5	→ 16384
S10-4	→ 8192
S10-3	→ 4096
S9-8	→ 128 (+)
<b>Total</b>	<b>28800</b>

Dip switches	N-data value
S10-4	→ 8192
S10-2	→ 2048
S10-1	→ 1024
S9-9	→ 256 (+)
<b>Total</b>	<b>11520</b>

• LOGIC-A UNIT

• TX UNIT

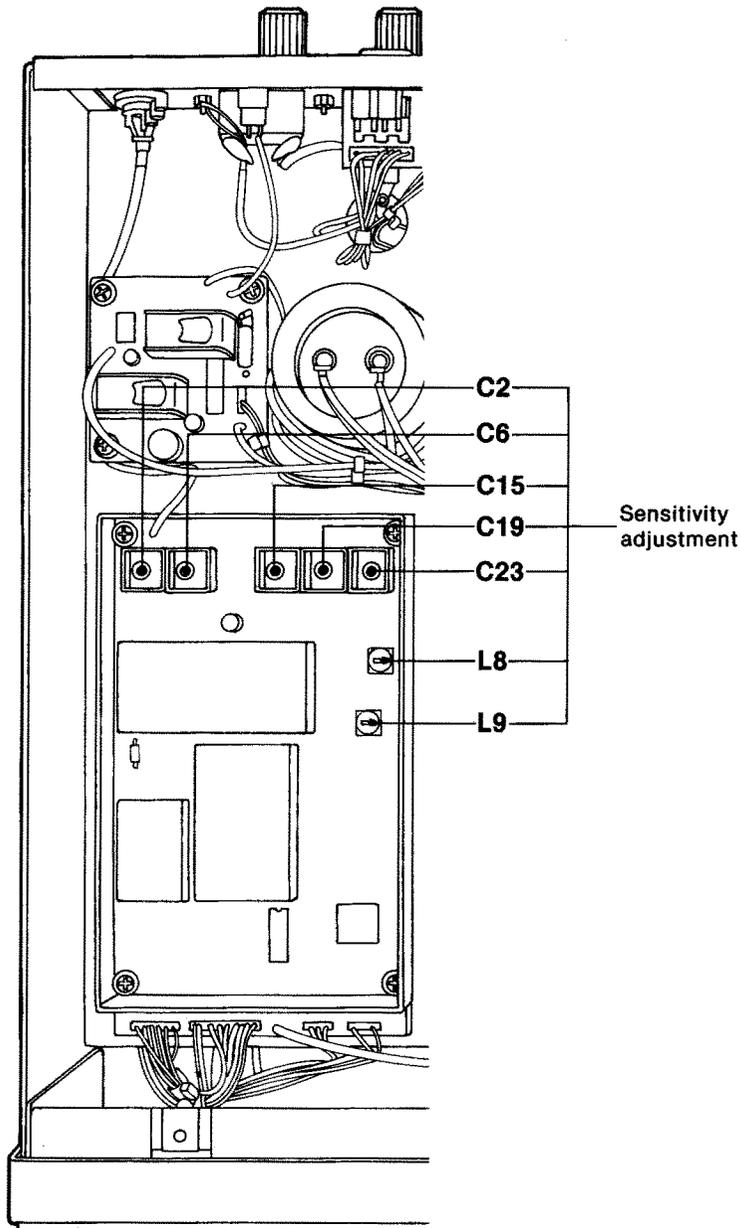

### 6-4 RECEIVER ADJUSTMENT

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
SENSITIVITY	1 <ul style="list-style-type: none"> <li>• [LOCAL INHIBIT] switch: ON</li> <li>• Connect the SSG to the [RX ANT] connector and set as:                             <ul style="list-style-type: none"> <li>Level : 10 <math>\mu</math>V* (-87 dBm)</li> <li>Modulation: 1 kHz</li> <li>Deviation : <math>\pm</math>3.5 kHz</li> </ul> </li> <li>• Receiving</li> </ul>	RX	Connect the distortion meter to the [MICROPHONE] connector, pin 3 (AF) and 6 (GND) with an AC millivoltmeter.	Minimum distortion level	RX	Adjust in sequence C2, C6, C15, C19, C23, L8, L9

\* This output level of the standard signal generator (SSG) is indicated as SSG's open circuit.

#### • RX UNIT

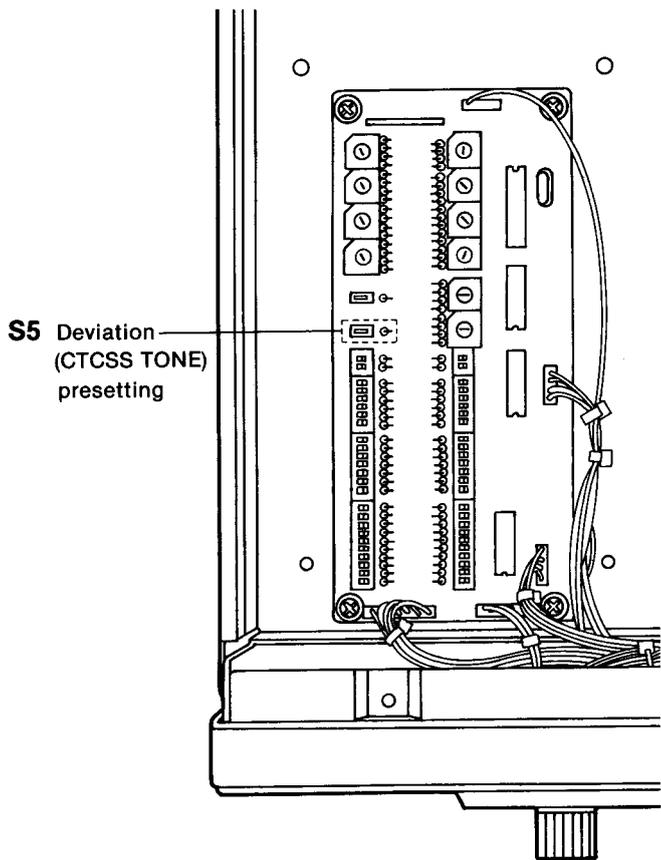

## 6-5 TRANSMITTER ADJUSTMENT

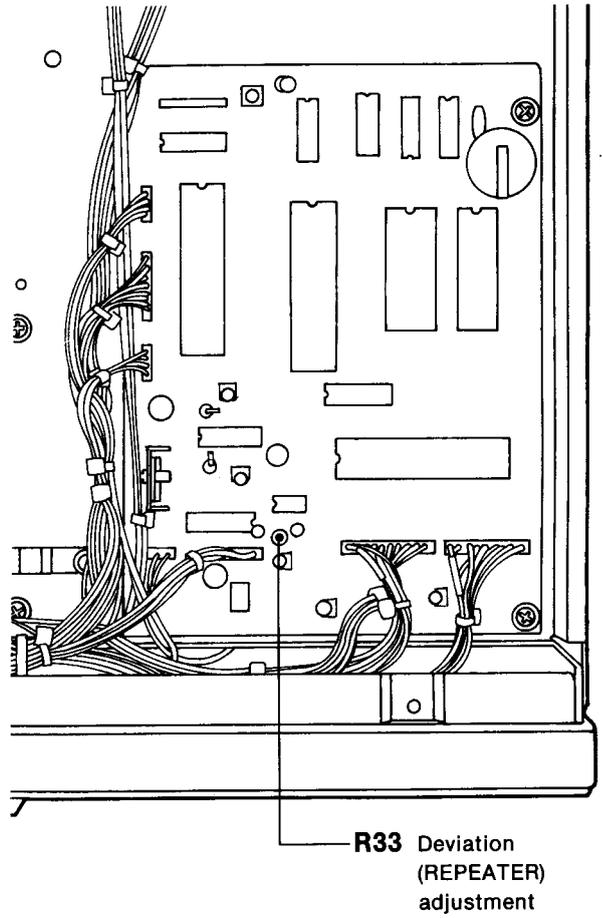

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT				
		UNIT	LOCATION		UNIT	ADJUST			
DEVIATION (CTCSS TONE)	1	<ul style="list-style-type: none"> <li>• [LOCAL INHIBIT] switch: ON</li> <li>• Set the FM deviation meter as: HPF : OFF LPF : 20 kHz De-emphasis: OFF Detector : (P-P)/2</li> <li>• Transmitting (Ground the [MICROPHONE] connector (pin 5).)</li> </ul>	Rear panel	Connect the FM deviation meter to the [TX ANT] connector via the attenuator.					
	2	<ul style="list-style-type: none"> <li>• S5 (LOGIC-A UNIT) switch: push once</li> </ul>					0.8 kHz	TX	R32
	3	After adjustment, turn the [LOCAL INHIBIT] switch OFF, and push S5 again.							
DEVIATION (MICROPHONE)	1	<ul style="list-style-type: none"> <li>• [LOCAL INHIBIT] switch: ON</li> <li>• Connect the audio generator to the [MICROPHONE] connector and set as: Level : 4 mV Modulation : 1.0 kHz</li> <li>• Set the FM deviation meter as: HPF : OFF LPF : 20 kHz De-emphasis: OFF Detector : (P-P)/2</li> <li>• Transmitting</li> </ul>	Rear panel	Connect the FM deviation meter to the [TX ANT] connector via the attenuator.	4.2 kHz	TX	R54		
	2	<ul style="list-style-type: none"> <li>• Set the audio generator as: Level : 40 mV</li> </ul>						4.0~5.0 kHz	Verify
	3	After adjustment, turn the [LOCAL INHIBIT] switch OFF.							
DEVIATION (REPEATER)	1	<ul style="list-style-type: none"> <li>• Connect the SSG to the [RX ANT] connector and set as: Level : 1.0 mV* (-47 dBm) Modulation : 1 kHz Deviation : <math>\pm 3.5</math> kHz</li> <li>• Set the FM deviation meter as: HPF : OFF LPF : 20 kHz De-emphasis: OFF Detector : (P-P)/2</li> <li>• Transmitting</li> </ul>	Rear panel	Connect the FM deviation meter to the [TX ANT] connector via the attenuator.	3.5 kHz	LOGIC	R33		
	2	<ul style="list-style-type: none"> <li>• Set the SSG as: Level : 1.0 mV* (-47 dBm) Modulation : 1 kHz Deviation : <math>\pm 5.0</math> kHz</li> </ul>						3.5~5.0 kHz	Verify

\* This output level of the standard signal generator (SSG) is indicated as SSG's open circuit.
