

**SERVICE
MANUAL**

UHF FM TRANSCEIVER

IC-U200T

FOREWORD

INTRODUCTION

This service manual describes the latest service information for the **IC-U200T** UHF FM TRANSCEIVER at the time of going to press.

Two versions of the **IC-U200T** have been designed. This service manual covers both versions.

VERSION NO.	VERSION	FREQUENCY RANGE	CHANNEL SPACING	OUTPUT POWER	5-TONE SPEC.
#01	General	450~470 MHz	12.5 kHz	25 W	CCIR
#02	General	450~470 MHz	25 kHz	25 W	CCIR

DANGER

DO NOT connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. Component part number and name.
2. Equipment model name and unit name.
3. 10-digit order numbers for mechanical parts.
4. Quantity required.

<SAMPLE ORDER>

IC MC3357P IC-U200T MAIN UNIT 5 pieces
Screw HS M4 x 35 SUS ZK IC-U200T Front panel 8810004240 10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTE

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from a power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 30 dB ~ 40 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

SECTION 1 SPECIFICATIONS

■ GENERAL

Frequency coverage	: 450 MHz~470 MHz
Antenna impedance	: 50 Ω unbalanced
Audio output impedance	: 4 Ω
Usable temperature range	: -30 °C ~ +60 °C
Frequency tolerance	: ± 2.5 kHz (#02) ± 1.5 kHz (#01)
Current drain	: Receive standby 450 mA Receive Max. audio 1.0 A Transmit 8.0 A
Power supply requirement	: 13.8 V DC (negative ground)
Dimensions	: 140(W) x 50(H) x 179(D) mm (Projections not included)
Weight	: 1.4 kg
5-Tone specification	: CCIR

■ TRANSMITTER

Output power	: 25 W
Emission mode	: 16K0F3E (#02) 8K50F3E (#01)
Limiting of modulator	: 70%~100% of max. deviation
Max. frequency deviation	: ± 5 kHz (#02) ± 2.5 kHz (#01)
Audio frequency response	: +1 dB ~ -3 dB with 6 dB/octave between 300 Hz ~ 3000 Hz (#02) between 300 Hz ~ 2550 Hz (#01)
Audio harmonic distortion	: 10% max.
Noise and hum ratio	: 40 dB
Adjacent channel power	: 70 dB

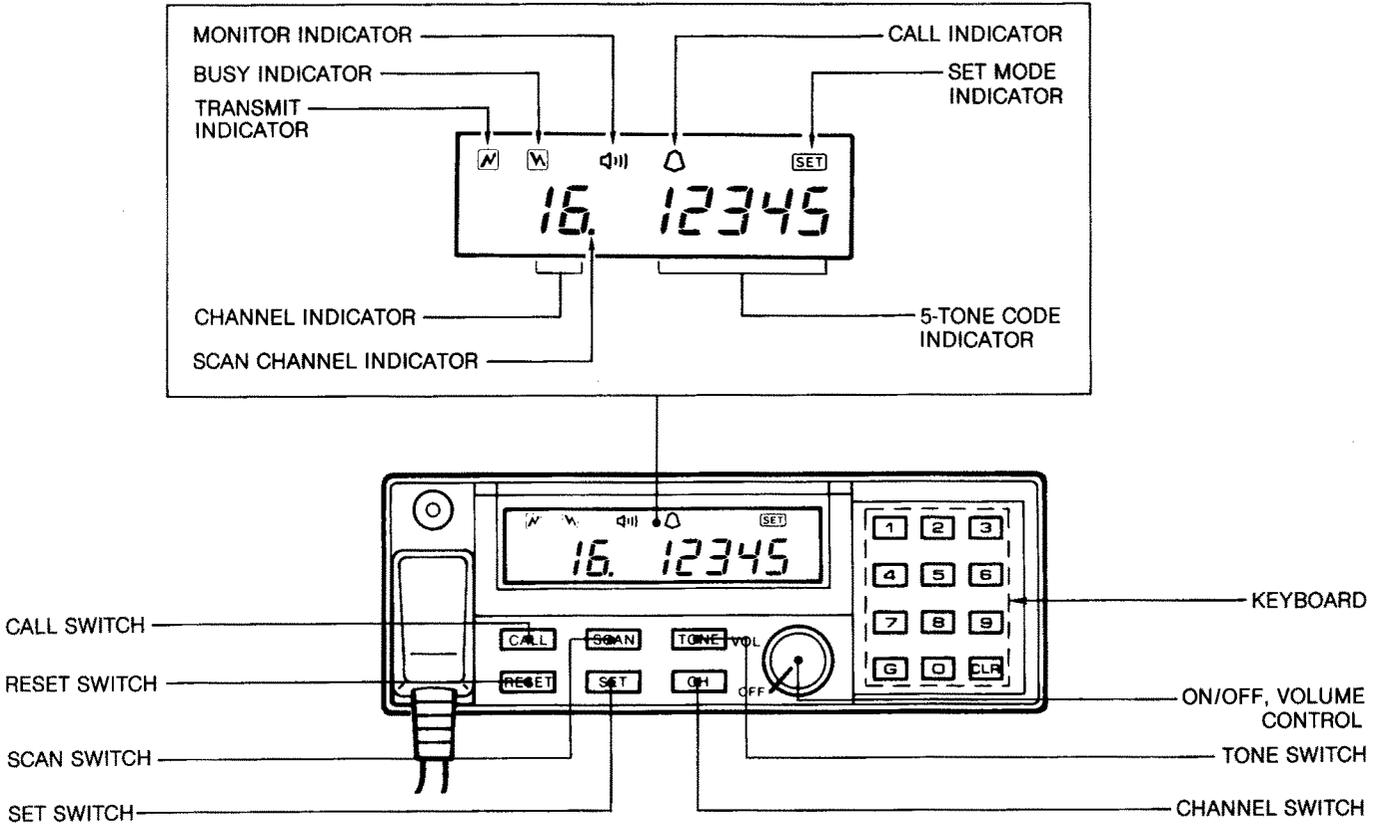

■ RECEIVER

Receiving system	: Double-conversion superheterodyne
Intermediate frequencies	: 1st 30.875 MHz 2nd 455 kHz
Intermodulation	: 70 dB
Sensitivity	: 0.35 μ V for 12 dB SINAD
Squelch sensitivity (threshold)	: 0.35 μ V
Audio output power	: 3.0 W at 10% distortion with a 4 Ω load
Adjacent channel selectivity	: 70 dB (#02) 60 dB (#01)
Spurious response rejection	: 70 dB
Blocking and desensitization	: 90 dB μ
Audio frequency response	: +1 dB ~ -3 dB with -6 dB/octave between 300 Hz ~ 3000 Hz (#02) between 300 Hz ~ 2550 Hz (#01)
Noise and hum ratio	: 40 dB

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT (MAIN UNIT)

Receive signals enter from the antenna connector and pass through a low-pass filter consisting of C215, C217, C219, C257 and L119~L121. They are then fed to an antenna switching circuit consisting of D119~D121.

4-1-2 RF CIRCUIT (MAIN AND RF UNITS)

Receive signals from the antenna switching circuit pass through a bandpass filter consisting of L1, L2, C2, C3, C6, C7, D3 and D4 to eliminate unnecessary signals. They are then amplified by N-channel GaAs FET Q1 for high-gain and low-noise amplification.

Signals amplified by Q1 pass through a 3-stage bandpass filter consisting of L3~L5, C13, C17, C18, C22, C23 and D3~D5. They are then fed into a balanced mixer circuit consisting of IC1, L6 and L7 where they are mixed with 1st LO signals. They are then converted to 30.875 MHz 1st IF frequency signals.

4-1-3 1st LO CIRCUIT (VCO UNIT)

The 1st LO signal is generated at the VCO circuit (Q270), amplified by Q271, and passed through a switching circuit and a low-pass filter before being applied to L103.

4-1-4 IF CIRCUIT (MAIN UNIT)

1st IF signals from L7 in the mixer pass through crystal filter F1101 and are amplified by Q101. The amplified signals are fed to IC101 (pin 16).

IC101 is an FM-IF IC chip. This IC chip includes an amplifier for the 2nd LO circuit, the 2nd mixer, the limiter amplifier, and the quadrature detector.

Signals entering IC101 (pin 16) are mixed with the 2nd LO signals of crystal X101 (30.42 MHz), and are emitted from pin 3 as the 2nd IF frequency of 455 kHz. These signals pass through the ceramic filter of F1102, enter pin 5, and are amplified at a limiter amplifier and detected by the quadrature detector in IC101 with ceramic resonator X102.

4-1-5 AF CIRCUIT (LOGIC-A UNIT)

The detected audio signals from IC101 (pin 9) pass through a de-emphasis circuit consisting of C116 and R113, and enter AF amplifier IC515a. The characteristics of the de-emphasis circuit are -6 dB/octave.

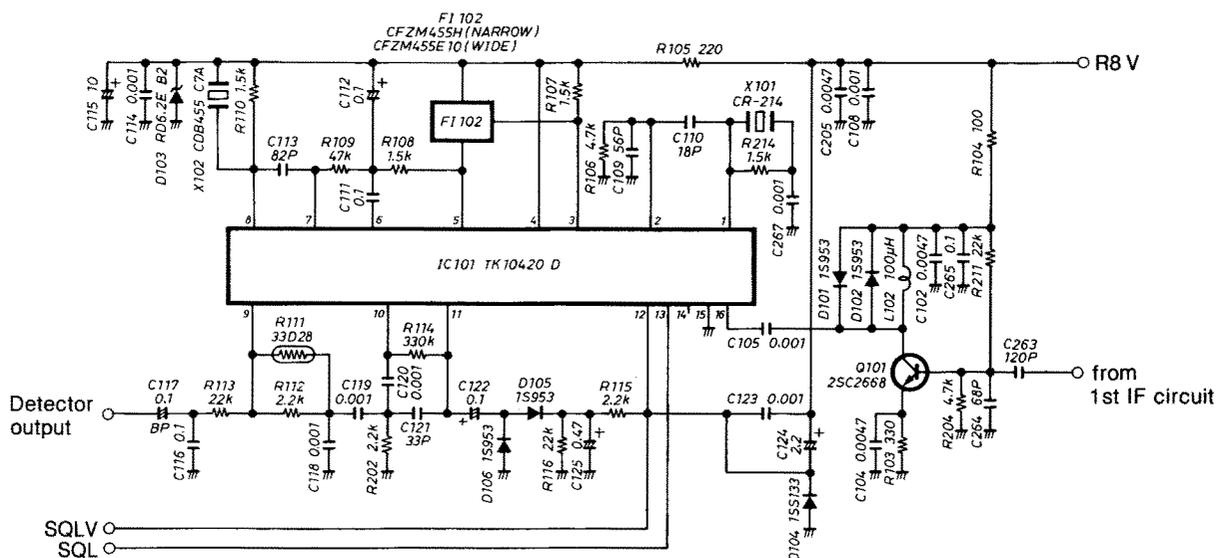

The AF signal from IC515a passes through AF control Q512 and is fed to IC515b to suppress a subaudible tone signal. The AF signal from IC515a is also fed to the 5-Tone decoder section in IC516.

The AF signal from IC515b is applied to the AF power amplifier (IC514) via analog switch Q511 and the VOLUME CONTROL (R1) on the front panel. The signal amplified by IC514 drives speaker SP1.

Q511 and Q512 function as a muting circuit using analog switches to block the AF signal. Q511 and Q512 block the signal when an RMUTE signal appears.

IC514 is a small-packaged power amplifier. High-power and low-distortion amplifiers and protection circuits for overload are collected in one package.

• 2ND IF CIRCUIT

4-1-6 SQUELCH CIRCUIT (MAIN AND LOGIC-A UNIT)

Audio signals from IC101 (pin 9) consist of noise components higher than 20 kHz that are amplified by IC101 then output from pin 11. Amplified noise signals are detected by D105 and D106, and are converted to DC voltage. This voltage is supplied to the squelch trigger circuit (pin 12). The squelch control pot (R543) in the LOGIC-A UNIT is also connected to IC101 (pin 12) to adjust converted DC voltage.

A "HIGH" or "LOW" squelch control signal is output from IC101 (pin 13) and then applied to CPU IC501 (pin 15) on the LOGIC-A UNIT.

IC301 (pin 30) becomes "HIGH" as the RMUTE signal while pin 15 receives "LOW". The RMUTE signal is applied to Q511 and Q512 to cut the audio signals.

4-2 TRANSMITTER CIRCUITS

4-2-1 MIC AMP, LIMITER AMP, SPLATTER FILTER AND VCO CIRCUIT

The AF signals from J403 are fed to IC512a via a pre-emphasis circuit consisting of C518 and R525. The characteristics of the pre-emphasis circuit are +6 dB octave.

After waveform adjustment with R527 and gain adjustment with R259 is made, output signals from IC512a are fed to limiter amplifier IC512b.

Output signals from IC512b pass through splatter filter IC513 which eliminates components greater than 3 kHz of the signals. The signals are then applied to D273 on the VCO UNIT as FM modulation signals.

4-2-2 DRIVER AMP (MAIN UNIT)

Signals generated at the VCO UNIT are buffer amplified at Q108. Signals from Q108 are amplified at Q110 and Q111, then at driver amplifier Q112. The signals are then amplified by Q111 and Q112 to get 200 mW of RF output power.

A TMUT signal prevents unnecessary RF power emissions from occurring at the moment of switching from receive to transmit mode or when the PLL circuit is unlocked. Q113 controls the bias voltage of Q110, Q112 using the TMUT signal.

(See Fig. 2 below)

4-2-3 POWER AMP CIRCUIT (MAIN UNIT)

The transmit output from the drive amplifier enters IC107 (pin 1). IC107 is an RF power module that can attain 25 W with an input of 200 mW.

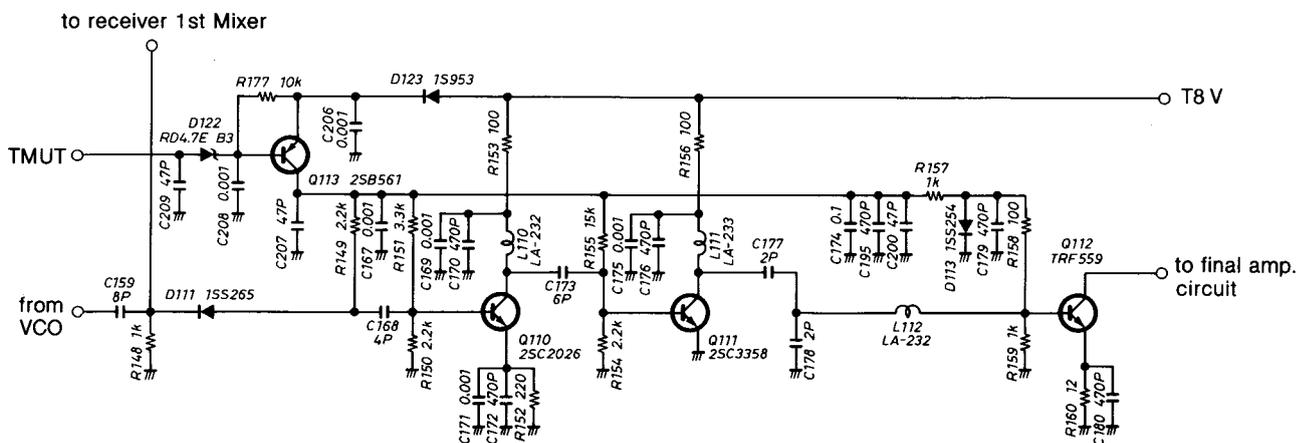

Output signals from IC108 (pin 4) are fed to the antenna switching circuit.

4-2-4 APC CIRCUIT (MAIN UNIT)

The APC circuit operates when the antenna impedance is not matched with the transceiver's antenna impedance. A part of output signals from IC107 (pin 5) is applied via a pattern coil to an APC detector circuit consisting of D117 and D118.

The detected voltage is fed into inverted amplifier IC108a. Output signals from IC108a are applied to Q115 and then the output voltage from Q115 controls the output current of Q114. The input current of IC107 (pin 2) and Q112 (collector) is controlled by Q114 to keep the output power of IC107 constant.

• DRIVER AMPLIFIER

4-2-5 ANTENNA SWITCHING CIRCUIT

Output signals from IC107 pass through a 3-stage low-pass filter consisting of L119, L121, C215, C217, C219 and C257 via D119. This filter suppresses high-frequency spurious signals.

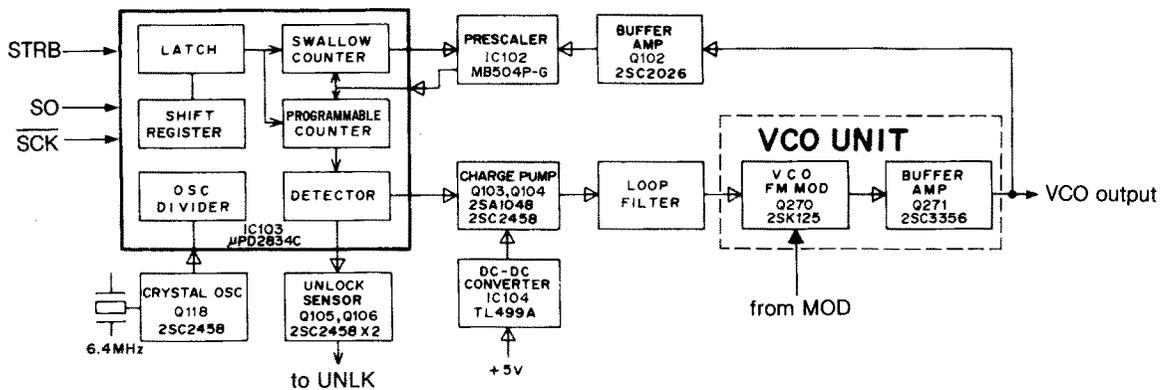

4-3 PLL CIRCUITS

4-3-1 DUAL MODULUS PRESCALER (MAIN UNIT)

The PLL is designed in a way that allows the desired frequency to be generated directly by the VCO, adopting a dual modulus prescaler system. The PLL consists of a prescaler (IC102) and PLL IC (IC103). It is fed "divided by N-data" from the CPU which determines the operating frequency.

N-data is determined by dividing the desired frequency by the reference frequency. The desired frequency is the transmit frequency in transmit mode and the first local oscillator frequency in receive mode.

$$N\text{-data} = \frac{\text{Desired frequency}}{\text{Reference frequency}}$$

A reference frequency of 12.5 kHz is acquired by X103, Q118, and the divider inside IC103. A signal from the VCO is buffer amplified at Q102, fed into IC102, and divided N times at IC102 and IC103. The divided signal is applied to the phase detector in IC103. Phase detection results in lock voltages being output from pins 12 and 13.

4-3-2 LOOP FILTER CIRCUIT (MAIN AND VCO UNITS)

Output from IC103 (pins 12 and 13) is fed into a charge pump circuit consisting of Q103 and Q104 and is then applied to a lag-lead type loop filter consisting of R132, R133 and C141.

The signal passing through the loop filter is fed to varactor diodes D271 and D272 in the VCO UNIT via RF choke coil L271 to control the VCO output frequency.

D109 and D110 shorten the lockup time when changing from receive to transmit mode or vice versa.

4-3-3 DC-DC CONVERTER (MAIN UNIT)

DC-DC converter IC104 makes 20 V DC from 5 V DC to obtain lock voltages for the PLL circuit and a voltage range of 1~20 V for bandpass tuning operation of the RF circuit.

4-4 LOGIC CIRCUITS

The logic circuit section consists of an 8-bit CMOS-type CPU, 8 K-byte CMOS RAM, 2 K-byte CMOS RAM, 5-Tone encoder/decoder and mainly displays frequency and tone numbers.

4-4-1 CPU (LOGIC-A UNIT)

CPU IC501 μPD78C06AG mainly performs all functions related to the controls and switches on the front panel of the IC-U200T and incorporates a 4 K-byte ROM and a 128-byte RAM in the chip. The ports are distributed as follows:

(1) DATA BUS (DB0~DB7)

This is an 8-bit data bus which performs data exchange with the 2 K-byte RAM. DB0~DB3 are also matrix input ports.

(2) ADDRESS BUS (PE0~PE15)

This is a 16-bit port which can switch ADDRESS and OUTPUT ports according to the program. PE13~PE15 are used as ENABLE signals for RAM, ROM or MATRIX selection.

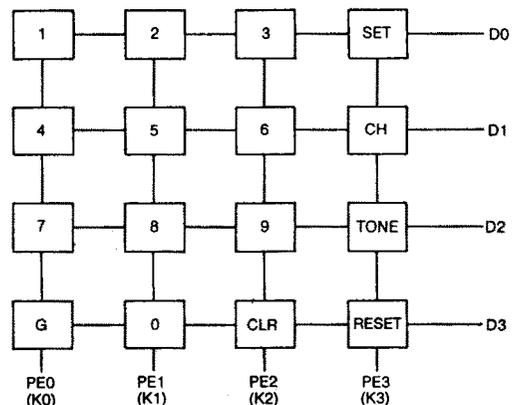

Fig. 4

(3) PORT A (PA0~PA7)

These are 8-bit output ports with latch capability.

PIN NO.	NAME	DESCRIPTION
27	PA0 (STRB0)	Outputs a latch signal for PLL N-data.
28	PA1 (CPO)	Outputs cloning data.
29	PA2 (PSAV)	Not used.
30	PA3 (RMUT)	This port becomes "HIGH" when the speaker sound is muted.
31	PA4 (TMUT)	This port becomes "HIGH" when RF power is turned OFF.
32	PA5 (CK)	Outputs a synchronized clock signal when PLL N-data is sent out.
33	PA6 (PLL C/D)	Outputs a signal for switching between PLL N-data and LCD command data as a switching signal.
34	PA7 (\overline{CS})	Outputs an enable signal of the LCD driver when LCD command data is sent out.

CLONING DATA CONSTRUCTION

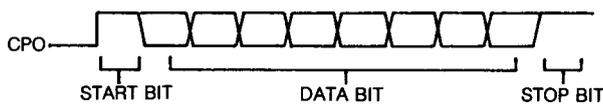

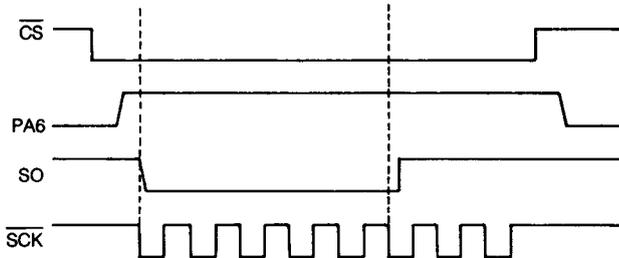

Fig. 5.

TIMING CHARTS OF THE ADDRESS BUS

• **AT COMMAND TRANSMITTING (CODE 0E0H, BLINKING ON)**

• **AT DATA TRANSMITTING (DATA 0A5H)**

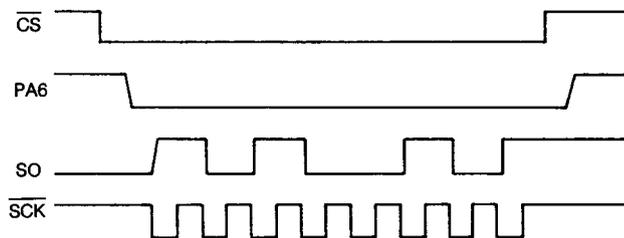

Fig. 6

(4) PORT B (PB0~PB7)

These are 8-bit ports which can switch between INPUT and OUTPUT per bit according to the program.

PIN NO.	NAME	DESCRIPTION
35~38	PB0~PB3 (S0~S3)	Input/output port for 5-Tone data.
39	PB4 ($\overline{T/R}$)	Output port for transmit/receive switching signal. The port becomes "LOW" during transmit and "HIGH" during receive.
40	PB5 (STRB1)	Output port for the 5-Tone encoder strobe signal.
41	PB6 (STRB2)	Output port for CTCSS tone data strobe signal.
42	PB7 (EXC)	When the received 5-Tone code is matched to the desired code, this terminal becomes "HIGH" for about 1 msec.

(5) PORT C (PC0~PC5)

These are 6-bit input/output ports.

PIN NO.	NAME	DESCRIPTION
11	PC5 (\overline{BUSY})	Input port for the \overline{BUSY} signal of the LCD driver.
12	PC3 (TRF)	Input port for "TX" INDICATOR. The indicator appears on the LCD when this port is "HIGH".
13	PC4 (FUNC)	Input port for the FUNCTION SWITCH. If this port is "LOW" when power is ON, it accepts the receive cloning input.
14	PC2 (SEND)	Input port for transmit/receive switching signals that are ready at a HIGH level (This terminal is used for cloning input.)
15	PC1 (SQL)	Input port for squelch open signal, which becomes "HIGH" when opened.
16	PC0 (UNLK)	Input port for PLL unlock signals. During unlock conditions, this port is "LOW".

(6) SERIAL PORT

PIN NO.	NAME	DESCRIPTION
19	\overline{SCK}	Output port for the SO data output timing signal. The data of the SO changes the trailing edge of \overline{SCK} .
21	SO	Output port for the shift register inside the CPU. This terminal outputs CTCSS tone data and LCD command data.

(7) OTHER PORTS

PIN NO.	NAME	DESCRIPTION
6	INT1	This port is "HIGH" when the CPU is in standby mode. When the POWER SWITCH is in the OFF position the port is "HIGH"; when the POWER SWITCH is in ON position the port is "LOW".
7	INT0	This is an input port for 5-Tone decoder data. The 5-Tone data is input when this port is "HIGH".
9	WR	This port outputs the timing signal when writing in the external memory (RAM).
18	BEEP	Output port for the beep tone signal.

4-4-2 ROM

IC502 is a CMOS, 8191-word 8-bit ROM.

This ROM memorizes the control program for the CPU (IC501). Reading data is performed by the address specified by PE0~PE12 in the CPU.

ROM READ TIMING DIAGRAM

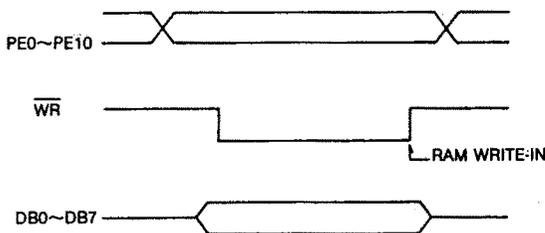

Fig. 7

4-4-3 RAM

IC503 is a CMOS 2048-word 8-bit RAM.

This RAM memorizes the channel, transmit/receive N-data, tone number, shift frequency, tone data table, etc., in current use.

Reading or writing data is performed by the address specified by PE0~PE10 in the CPU.

RAM READ TIMING DIAGRAM

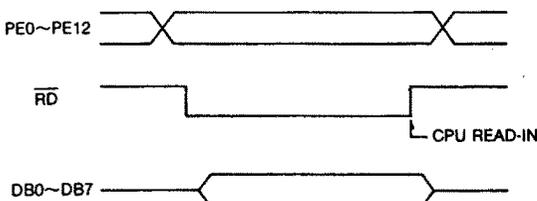

Fig. 8

RAM WRITE TIMING DIAGRAM

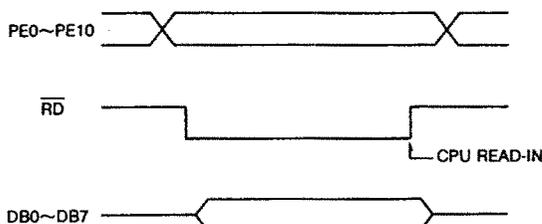

Fig. 9

4-4-4 5-TONE GATE ARRAY (LOGIC-A UNIT)

IC516 contains a 5-Tone encoder/decoder, data selector, serial-parallel converter, a driver and inverter. The 5-Tone encoder can generate 12 kinds of tones.

PIN NO.	NAME	DESCRIPTION
64~61	IO0~IO3	These ports are 5-Tone data input/output ports for the 5-Tone encoder/decoder.
60	CON1	This port is used for selecting either the input or output ports of IO0~IO3. The port becomes "LOW" for output and "HIGH" for input.
59	RX	This port is used for selecting either the encoder or decoder function. It becomes "LOW" for encoding and "HIGH" for decoding.
44, 45	TO1, TO2	These ports select one of the 5-Tone sequential systems: CCIR, ZVEI, EEA or EIA.
57	ST1	This port inputs a strobe signal for the 5-Tone encoder/decoder.
40~43	EC, EC0~EC2	These ports output 5-Tone encoder data.
21	DS	This port is used as an input port for 5-Tone signals.
8	ST3	This port outputs a strobe signal for the 5-Tone encoder/decoder.
2~4	SE1~SE3	This port is used as a data selector.
39~36, 55~52, 51, 50	MA0~MA3, DB0~DB3, CE1, CE2	Function of each port (CE1, CE2, and DB0~DB3) is determined by data from ports SE1~SE3. Ports MA0~MA3 are allocated as data input.
56, 7, 6	ST2, SCK2, SI2	These are serial input ports for converting data from sequential to parallel.
13~20	P1~P8	These are used as parallel output ports after data is converted from serial to parallel. P1~P3 signals are sent to the optional UT-31 CTCSS UNIT.
9, 11	IN1, IN2	These ports are connected to internal inverter inputs.
10, 12	OUT1, OUT2	These ports are connected to internal inverter outputs.
5	KO1	This port outputs a 4.48 MHz clock signal for CPU IC501.
23~25, 28~33, 46~49	TEST, T1, SET, RES, CON2, RCE, RT2, RT1, CP1, DATC, KO5, KO4, KO2	These ports are used for checking IC testing.

5-TONE FREQUENCY SETTINGS

5-TONE CODE	FREQUENCY			
	CCIR (Hz)	EEA (Hz)	ZVEI (Hz)	EIA (Hz)
0	1981	1981	2400	600
1	1124	1124	1060	741
2	1197	1197	1160	882
3	1275	1275	1270	1023
4	1358	1358	1400	1164
5	1446	1446	1530	1305
6	1540	1540	1670	1446
7	1640	1640	1830	1587
8	1747	1747	2000	1728
9	1860	1860	2200	1869
G	2400	1055	2800	2151
R	2110	2110	2600	459

4-4-5 SERIAL-PARALLEL CONVERTER (LOGIC-A UNIT)

Serial CTCSS data from the CPU (IC501) is converted to parallel data at IC516 and is applied to the optional CTCSS UNIT.

4-4-6 HORN-HONK DRIVER CIRCUIT (LOGIC-A UNIT)

The horn-honk driver circuit consists of IC510 and Q513. If the transceiver acknowledges a 5-Tone signal, IC501 (pin 42) outputs one pulse signal to IC510, and then IC510 turns Q513 ON for about 2 seconds.

4-4-7 AF MUTE AND 5-TONE CANCELLER CIRCUITS (LOGIC-A UNIT)

When an optional UT-31 CTCSS UNIT is installed, a DOUT signal (J512) becomes "LOW" and then the collector of Q518 becomes "HIGH".

The output signal (Q518) is applied to the gates of Q511 and Q512 via D510.

"HIGH" signals from Q518 turn Q511 and Q512 ON, and then AF signals are muted. Simultaneously, signals are applied to IC501 (pin 7, INT0) via Q504. Thus the interrupt signal from the 5-Tone encoder/decoder circuit is canceled.

While a CTCSS tone signal is received, DOUT signals become "LOW" and AF signal muting is released if the tone number matches the desired number.

When a HANG signal from J505 (pin 7) is "HIGH", Q506 turns OFF and the CTCSS UNIT does not function.

4-5 DISPLAY CIRCUITS (DISPLAY AND LOGIC-A UNITS)

IC401 is a programmable LCD controller/driver. DS401 is an LCD panel which displays the following indicators:

- 5-Tone code
- Channel number
- Transmit/Receive
- Answer back

A voltage regulator circuit consisting of Q510 and D512 applies 8 V to DS402 and DS403 for illuminating the LCD.

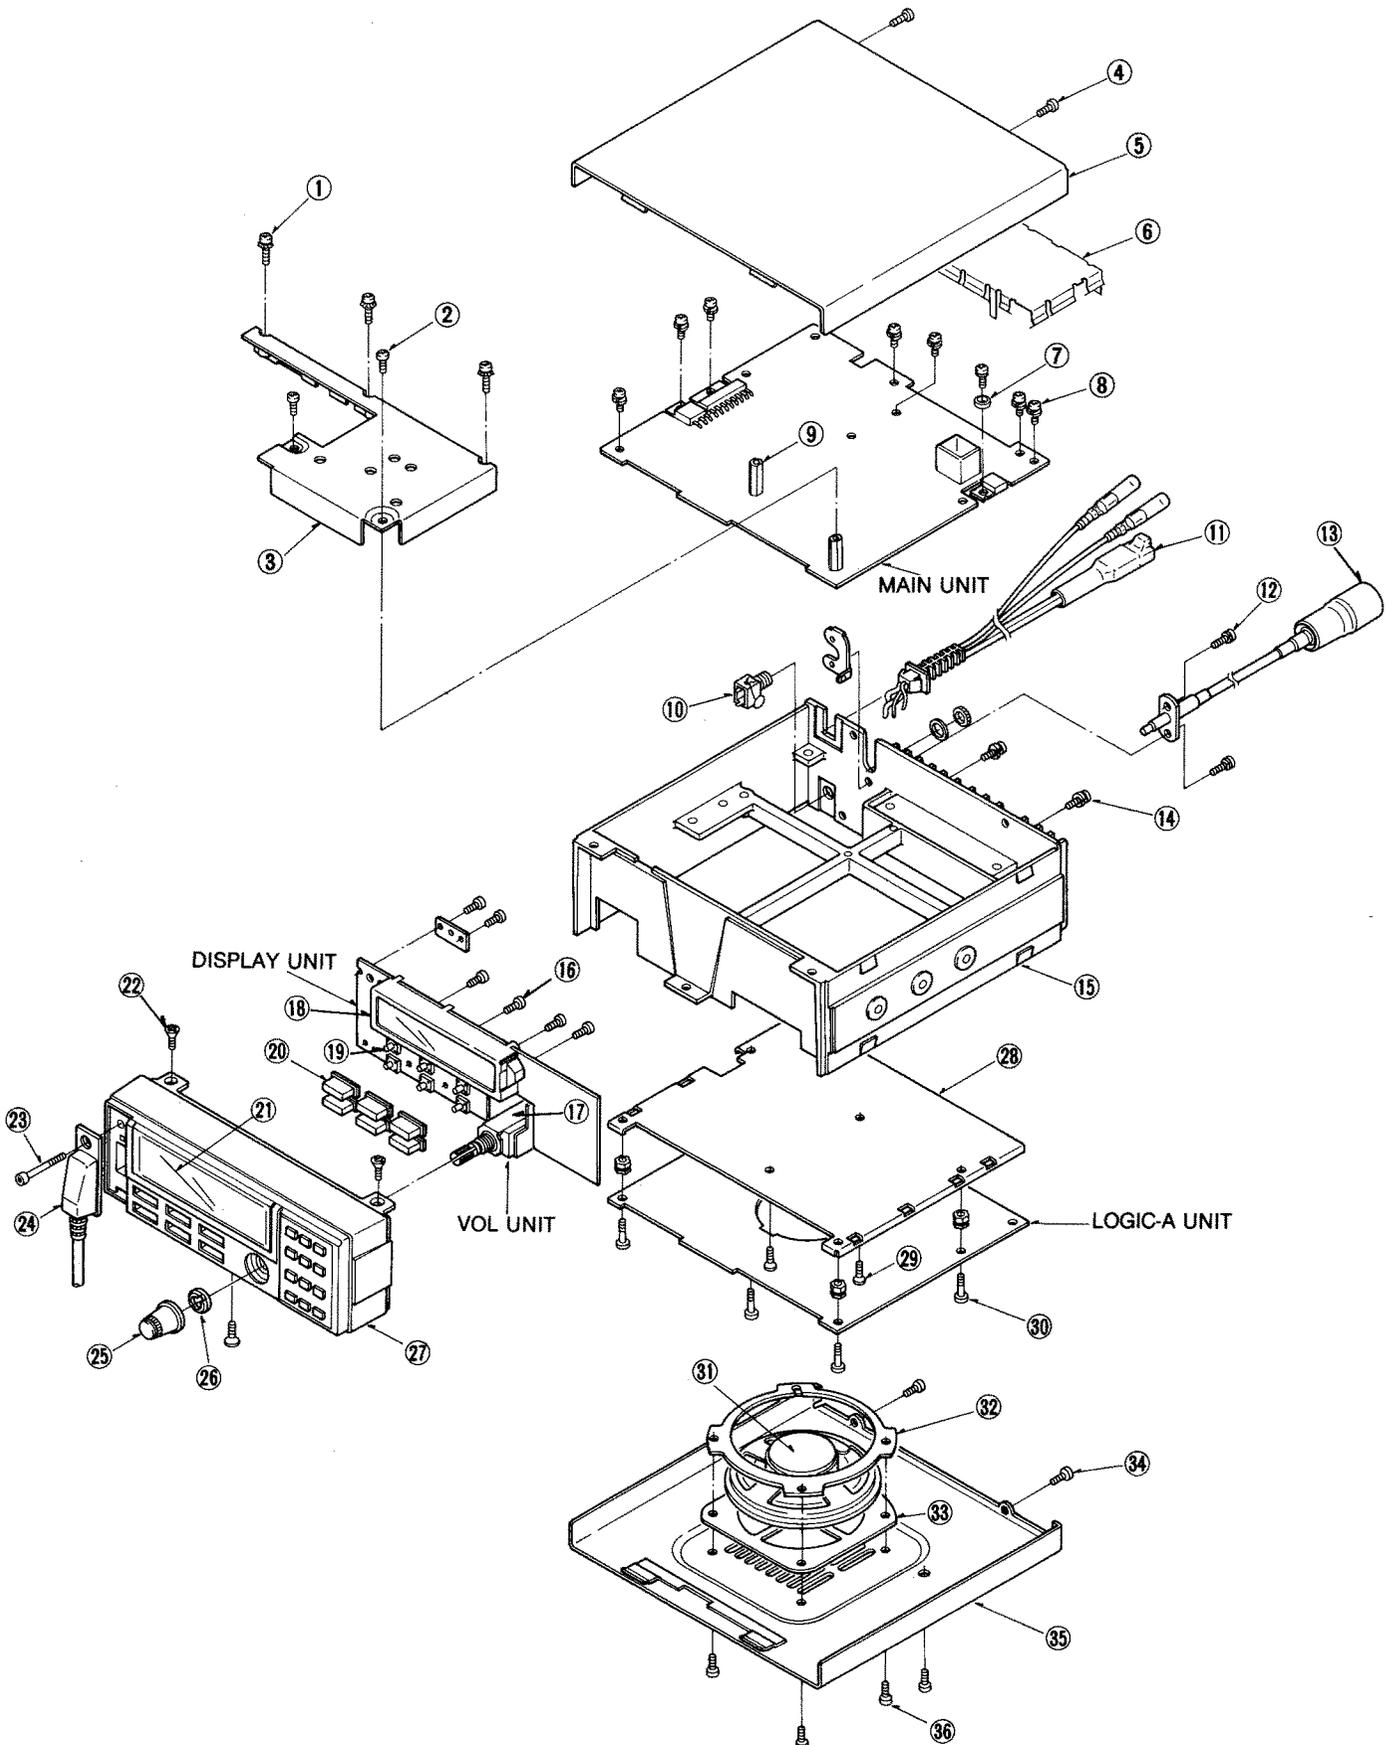

4-6 VOLTAGE REGULATOR CIRCUITS (MAIN UNIT)

The 13.8 V line passes through the POWER SWITCH on the front panel and is applied to IC106 on the MAIN UNIT. IC106 is a voltage regulator with a selector switch IC chip that applies a constant 8 V, R8 voltage during receive, and T8 voltage during transmit operations.

IC105 outputs a constant 5 V. The voltage is applied to IC103 and IC104 on the LOGIC-A UNIT.

5-2 FRONT AND MAIN UNITS CONNECTOR ASSEMBLY

- * 1 FLAT CABLE (MAIN-LOGIC-A)
STYLE-2468 AWG26 VW-1 E43172 (10)
- * 2 FLAT CABLE (MAIN-LOGIC-A)
STYLE-2468 AWG26 VW-1 E43172 (5)

5-3 FRONT AND LOGIC-A UNITS CONNECTOR ASSEMBLY

SECTION 6 ADJUSTMENT PROCEDURES

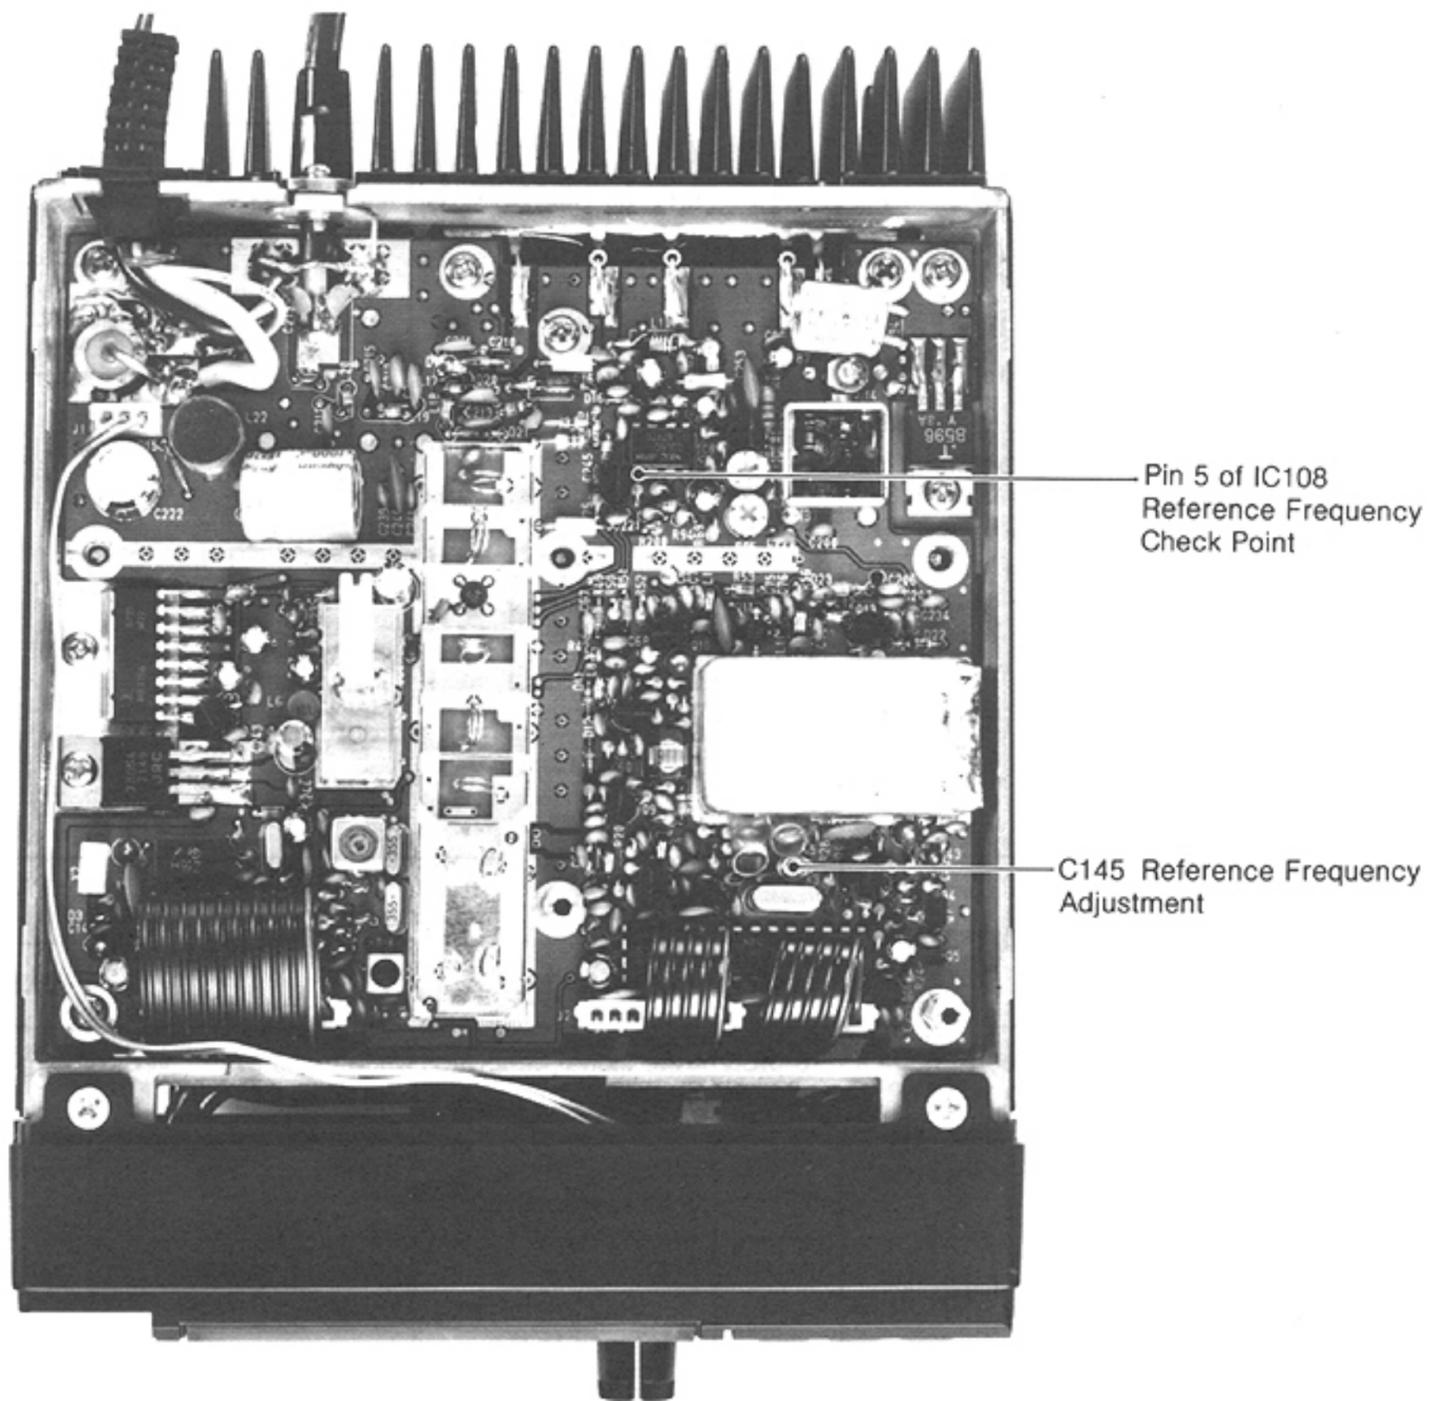

6-1 PREPARATION BEFORE SERVICING

- Detach** the power cord and turn OFF the POWER SWITCH before performing any work on the transceiver.
- DO NOT** force any of the variable components. Turn them slowly and smoothly.
- Follow the instructions exactly. If an indicated result is not obtained, repeat the instruction until the correct result is obtained.
- Confirm defective operation of the transceiver first when checking an out-of-service unit. Verify that external sources **DO NOT** cause the problem.
- Remove the transceiver covers.
- For transmission problems, connect a dummy load to the ANTENNA CONNECTOR. For reception problems, connect an antenna or signal generator to the ANTENNA CONNECTOR. **DO NOT** transmit into the signal generator.
- Re-check for the suspected malfunction with the POWER SWITCH ON.
- There are different versions of this transceiver. Adjustment procedures and results may differ for each version. Be sure to follow the correct procedure for the transceiver you adjust.

6-2 PLL ADJUSTMENT

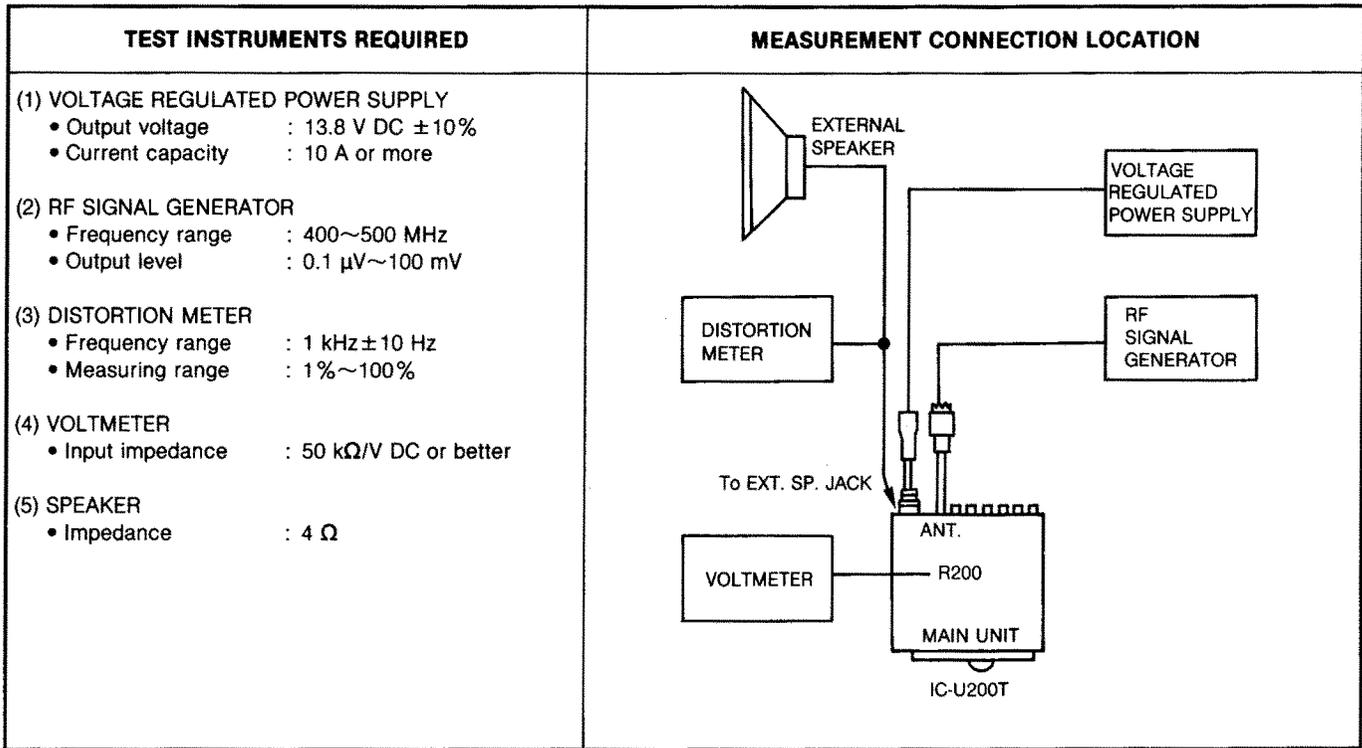

TEST INSTRUMENTS REQUIRED		MEASUREMENT CONNECTION LOCATION				
(1) VOLTAGE REGULATED POWER SUPPLY • Output voltage : 13.8 V DC \pm 10% • Current capacity : 10 A or more (2) RF POWER METER • Terminated type • Measuring range : 5~30 W • Frequency minimum : At least 500 MHz • Impedance : 50 Ω (3) VOLTMETER • Input impedance : 40 k Ω /V DC or better (4) FREQUENCY COUNTER • Frequency minimum : At least 500 MHz • Frequency accuracy : 1 ppm or better • Sensitivity : 100 mV or better						
ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST
LOCK VOLTAGE	1 • Operating frequency: 450.000 MHz • Receive mode	MAIN	Connect a voltmeter to pin 5 of IC108.	Approx. 7.5 V		Verify
	2 • Operating frequency: 450.000 MHz • Transmit mode			Approx. 10.5 V		Verify
	3 • Operating frequency: 470.000 MHz • Receive mode			Approx. 9.5 V		Verify
	4 • Operating frequency: 470.000 MHz • Receive mode			Approx. 12.5 V		Verify
REFERENCE FREQUENCY	1 • Operating frequency: 450.00 MHz • Transmit mode	MAIN	Make a loose coupling between a frequency counter and the ANTENNA CONNECTOR.	450.00 MHz	MAIN	C145

MAIN UNIT

NOTE: Add "100" to the indicated numbers which are "100" or less on the unit for the actual part number.

6-3 RECEIVER ADJUSTMENT

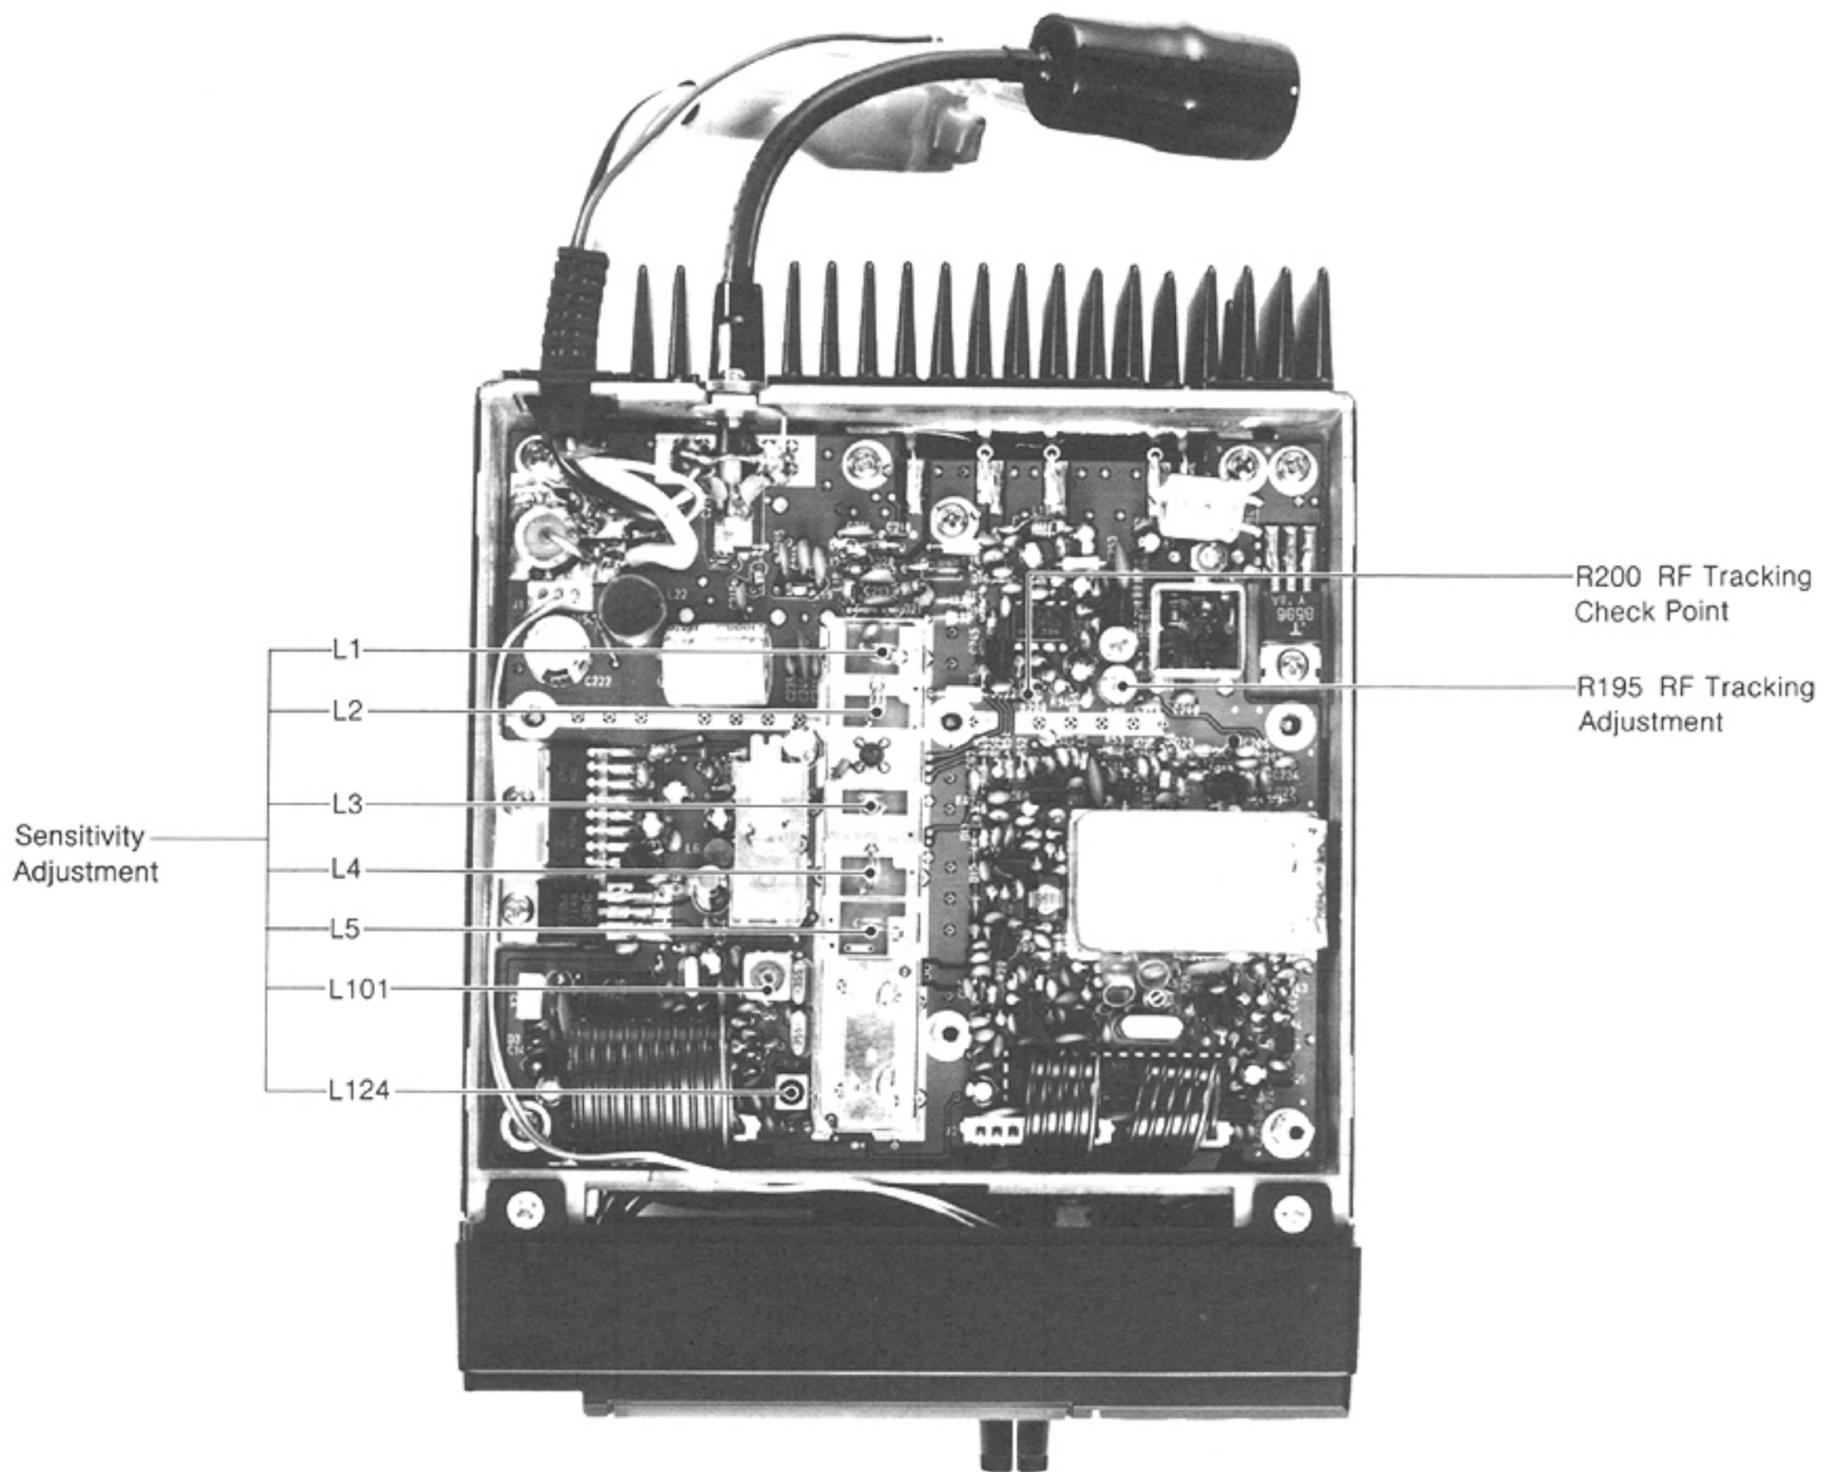

ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
		UNIT	LOCATION		UNIT	ADJUST

CAUTION: The answer back function must be turned OFF to protect the signal generator while making receiver adjustment. See p. 18 in the PROGRAMMING MANUAL (A-0876) for details.

RF TRACKING	1	<ul style="list-style-type: none"> • Operating frequency: 450.00 MHz 	MAIN	Connect the voltmeter to R200.	8.0 V	MAIN	R195
SENSITIVITY	1	<ul style="list-style-type: none"> • Operating frequency: 460.00 MHz • Apply an RF signal to the ANTENNA CONNECTOR. Level : 0.5 μV Mod. : 1 kHz Dev. : \pm1.75 kHz (#01) \pm3.5 kHz (#02) • ON/OFF, VOLUME CONTROL: PULL ON (Squelch opens) • Push [RESET] to turn ON the monitor function. 	REAR PANEL	Connect the distortion meter with a 4 Ω load to the EXTERNAL SPEAKER JACK.	Minimum distortion level	MAIN	L101 L124
						RF	L5 L4 L3 L2 L1

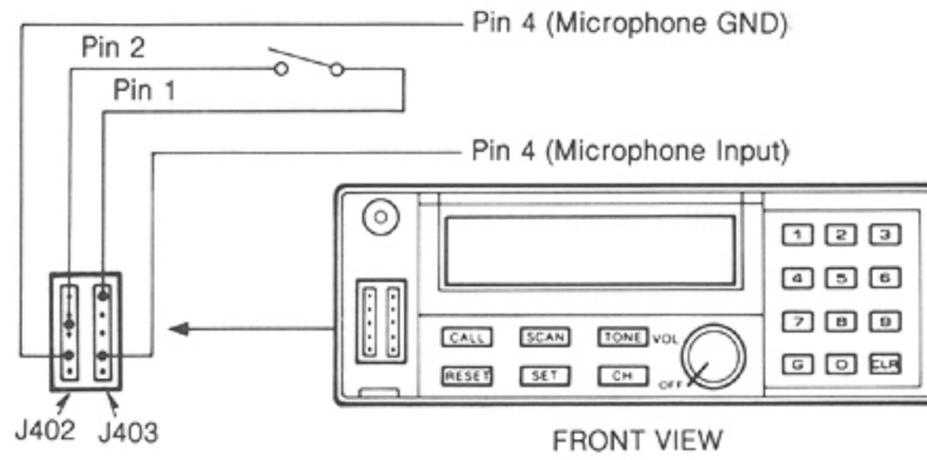

MAIN AND RF UNITS

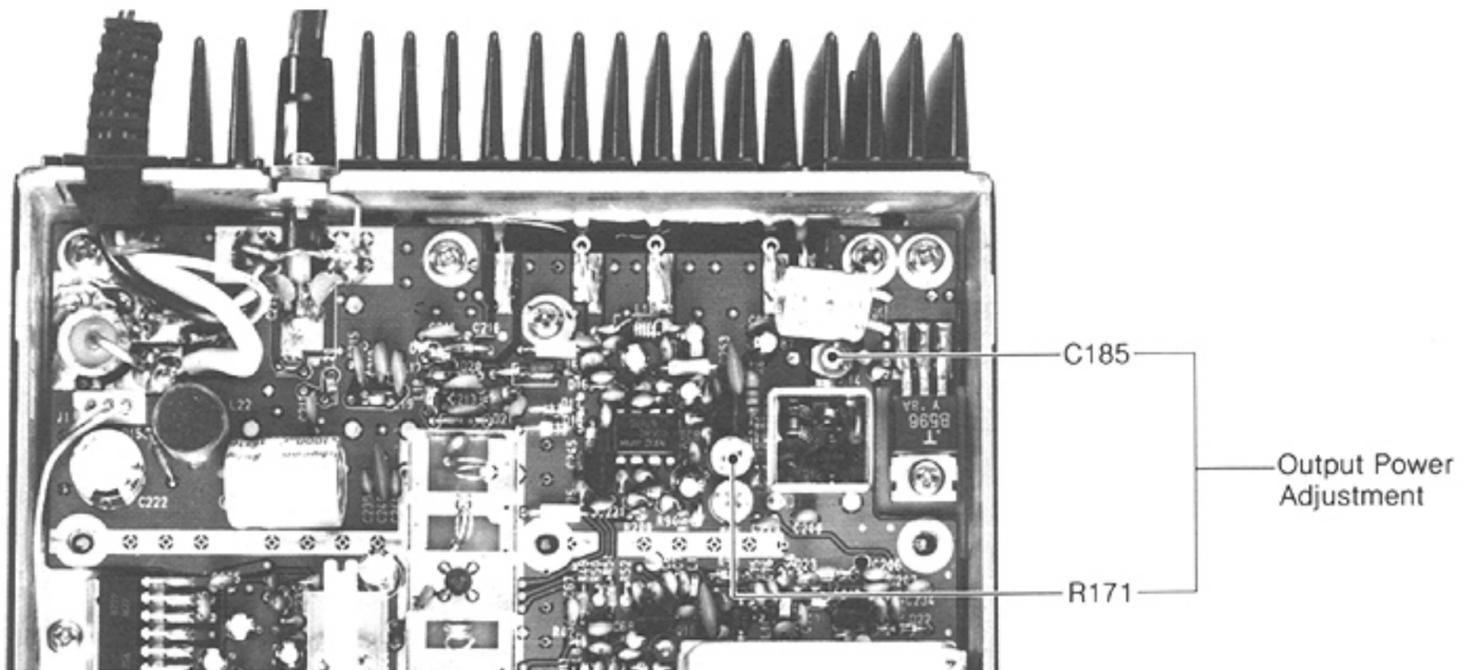

NOTE: Add "100" to the indicated numbers which are "100" or less on the unit for the actual part number.

6-4 TRANSMITTER ADJUSTMENT

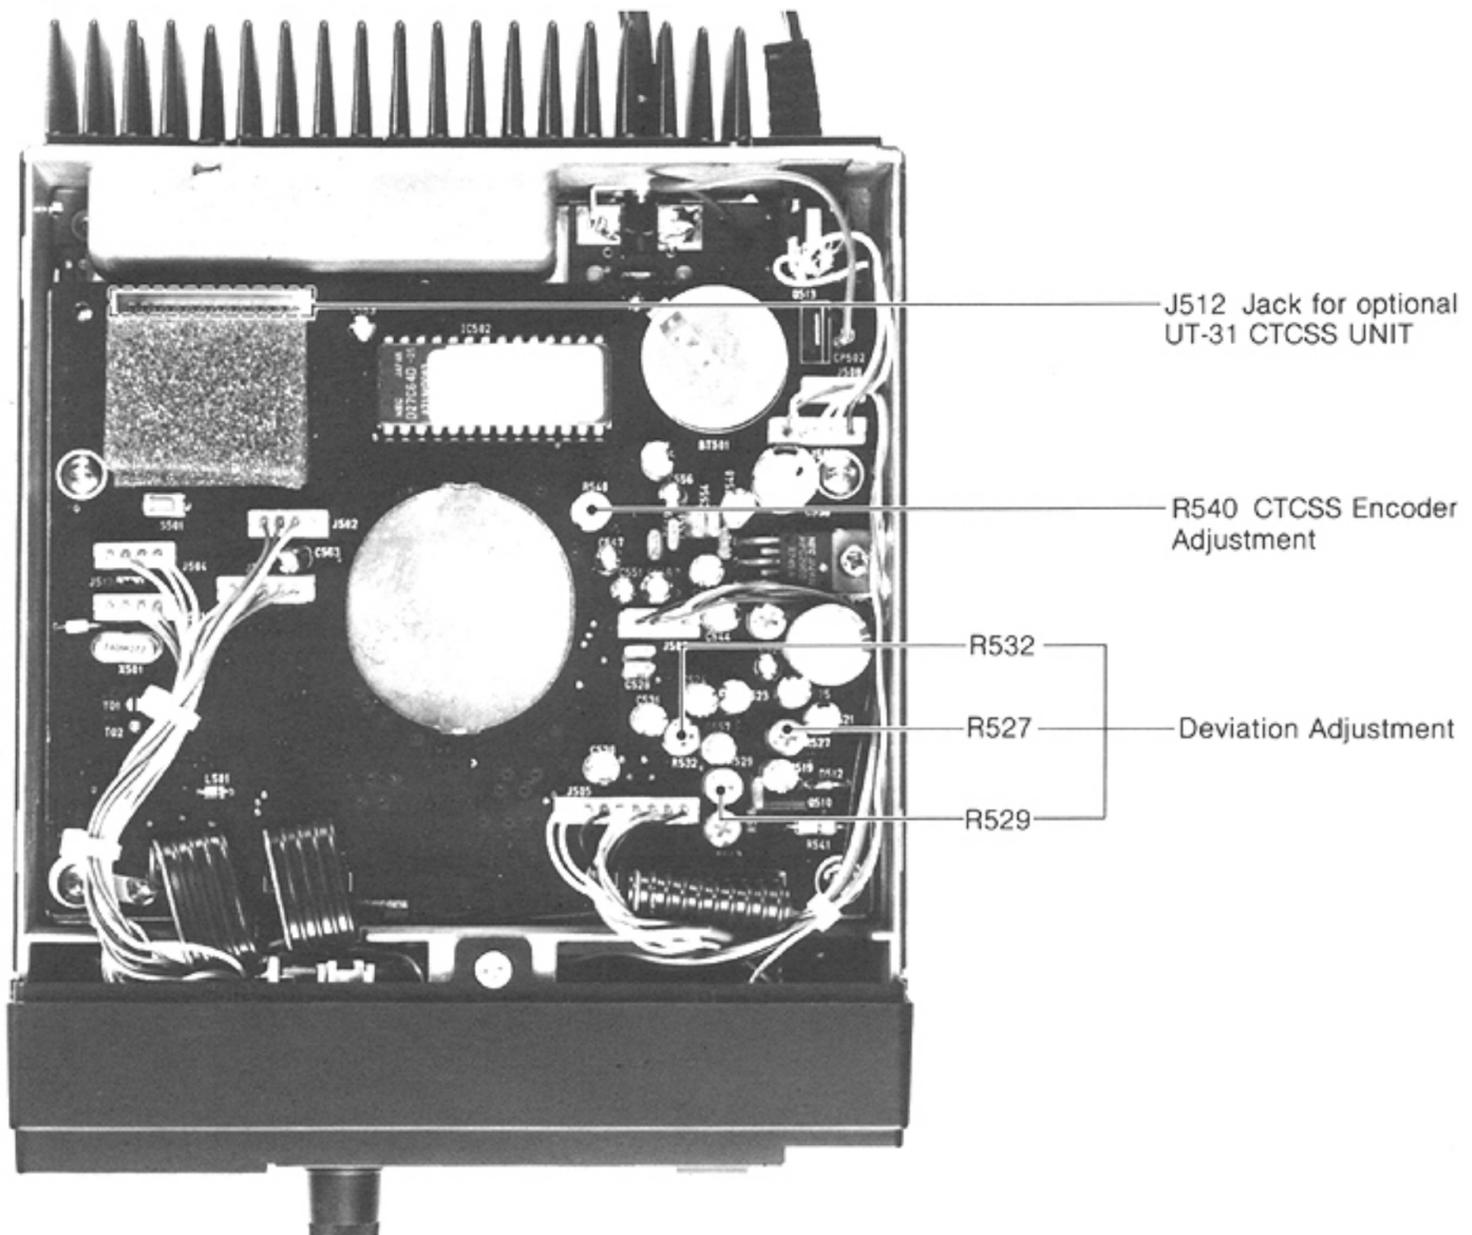

TEST INSTRUMENTS REQUIRED		MEASUREMENT CONNECTION LOCATION					
(1) VOLTAGE REGULATED POWER SUPPLY • Output voltage : 13.8 V DC \pm 10% • Current capacity : 10 A or more (2) RF POWER METER • Terminated type • Measuring range : 5~25 W • Frequency minimum : At least 500 MHz • Impedance : 50 Ω (3) DEVIATION METER • Frequency range : 400~500 MHz • Measuring range : 0~ \pm 5 kHz (4) AC MILLI-VOLTMETER • Measuring range : 5 mV~10 V (5) ATTENUATOR • Attenuation : 30 dB or 40 dB							
ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT		
		UNIT	LOCATION		UNIT	ADJUST	
OUTPUT POWER	1	REAR PANEL	Connect the RF power meter to the ANTENNA CONNECTOR.	Maximum power	MAIN	C185	
	2			25 W		R171	
DEVIATION	1	REAR PANEL	Connect the deviation meter to the ANTENNA CONNECTOR via the attenuator. Deviation meter: LPF: 20 kHz HPF: OFF Deemphasis: OFF Detector: P-P/2	\pm 2.2 kHz (#01) \pm 4.4 kHz (#02)	LOGIC-A	R532	
	2			Connect the oscilloscope to the deviation meter.		Symmetrical waveform	R527
	3			Connect the deviation meter to the ANTENNA CONNECTOR via an attenuator.		\pm 1.75 kHz (#01) \pm 3.5 kHz (#02)	R529
TRANSMIT S/N RATIO	1	REAR PANEL	Connect the AC milli-voltmeter to the deviation meter.	The ratio of the AC milli-voltmeter levels between 5 mV input and no signal input should be: More than 35 dB (#01) More than 40 dB (#02)		Verify	
	2						Apply no AF signal to the MIC CONNECTOR.
NOTE: An optional UT-31 CTCSS UNIT is required for CTCSS encoder adjustment.							
CTCSS ENCODER	1	REAR PANEL	Connect the deviation meter to the ANTENNA CONNECTOR.	\pm 0.3 kHz (#01) \pm 0.5 kHz (#02)	LOGIC-A	R540

SECTION 9 OPTIONAL UNITS

9-1 UT-31 CIRCUIT DESCRIPTION

9-1-1 GENERAL DESCRIPTION

IC2 is a tone encoder/decoder IC chip that outputs and detects 37 different kinds of tones from 67~250.3 Hz. A tone is set by data signals from the CPU in the IC-U200T.

Crystal unit X1 is used in the circuit as the reference oscillator. By using this crystal unit, the UT-31 achieves very high frequency stability for tone signals.

9-1-2 ENCODER CIRCUIT

IC501, the CPU in the transceiver, outputs programming data through S0~S5 data lines to IC2.

When the transceiver is in transmit mode, "LOW" is applied to pin 12 of IC2. Pin 26 outputs the programmed tone signal. The signal is applied to the modulator circuit in the transceiver.

9-1-3 DECODER CIRCUIT

When the transceiver is in receive mode, "HIGH" is applied to pin 12 of IC2. Pin 1 of IC515a on the transceiver LOGIC-A UNIT outputs detected signals. The signals are applied to the AF IN line on the UT-31.

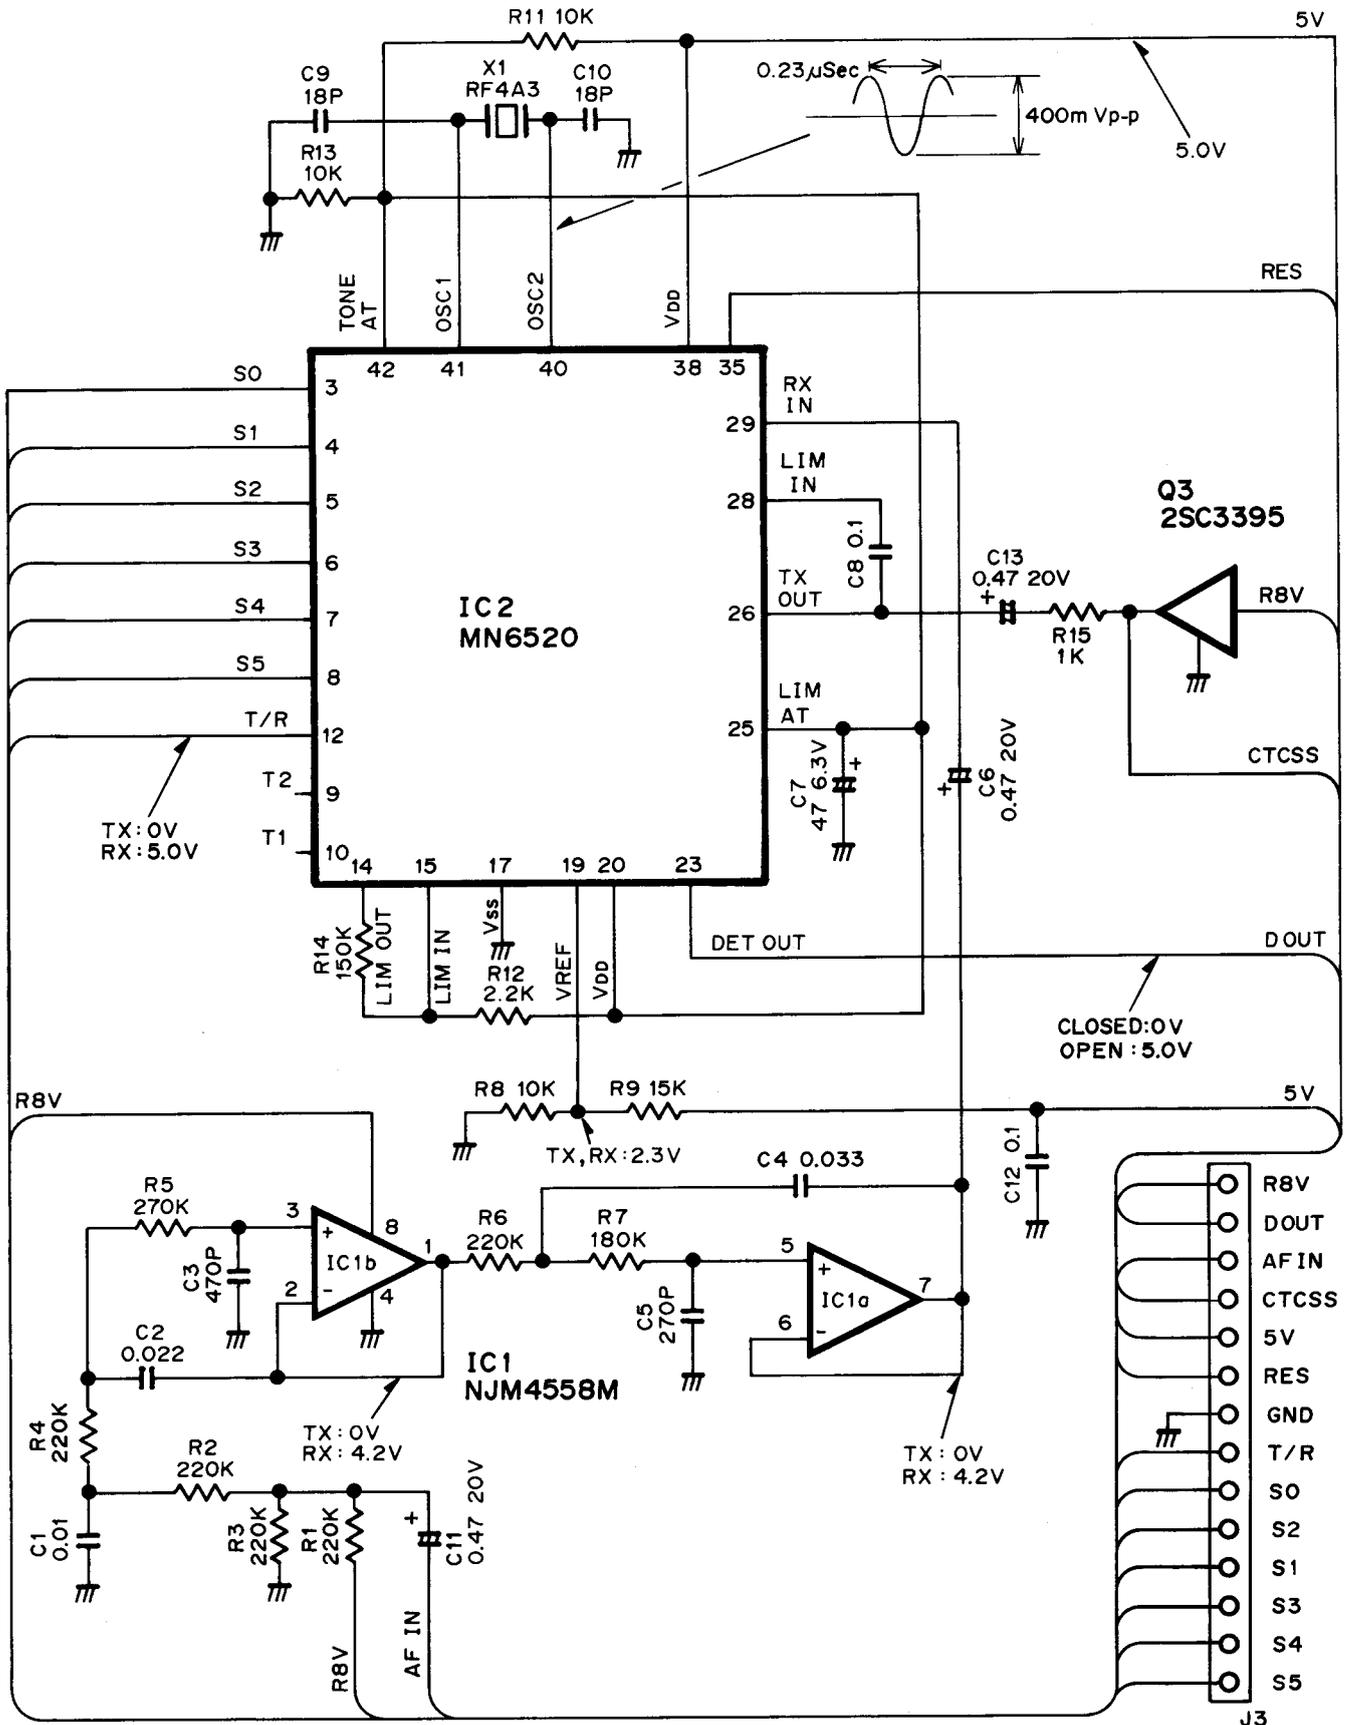

IC1a and IC1b form a low-pass filter which passes signals of approximately 300 Hz or less. Detected and filtered signals are applied to pin 29 of IC2 through C6.

When the received tone frequency is matched with the programmed tone frequency, pin 23 becomes "HIGH" and the DOUT line becomes "HIGH." Therefore, the squelch on the transceiver opens.

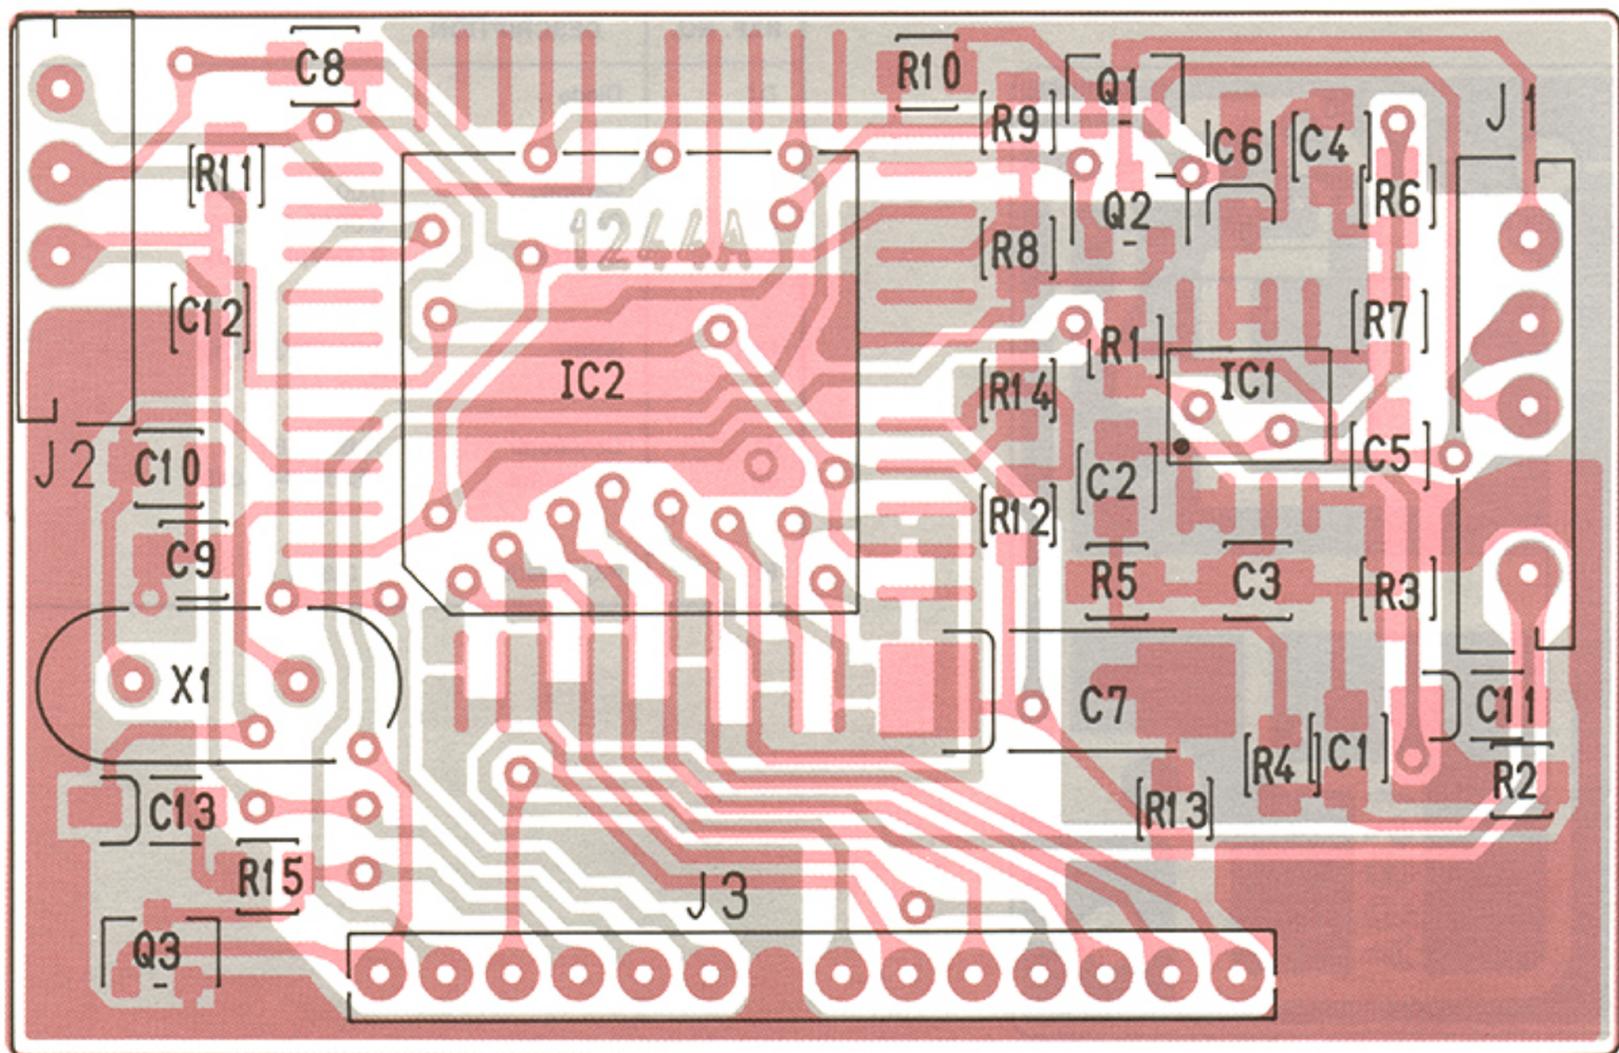

9-1-4 SUBAUDIBLE TONE FREQUENCY AND DATA CHART

OUTPUT FREQUENCY [Hz]	IC2 INPUT PIN NUMBER					
	3	4	5	6	7	8
67.0	L	H	H	H	H	H
