

1) COMPOSITION

2) DESCRIPTION

RP2.pdf

The service manual for ID-RP2 including all service information in this CD. This file is mainly used for viewing on the computer display and checking page order to make printed service manual. Or when you want to find a component, you can find very fast using "FIND" function (except Board Layouts).

A3format.pdf

Consists of A3 format pages (Board layouts, Mechanical parts and disassembly, and etc.). This file is used for printing out A3 format pages.

A4format.pdf

Consists of A4 format pages (Circuit description, Adjustment procedures, Parts list, and etc.). This file is used for printing out A4 format pages.

Instruction.pdf

The instruction manual for ID-RP2. The contents of this file is exactly same as supplied instruction manual with product and consists of all A4 format pages. If you have A4 format printer, you can print and make brand new instruction manual any time you want. This file is also very helpful when you want to change or set product setting condition for adjustment or else.

ar505eng.exe

ar505eng.exe is an installation program of Adobe® Reader 5.0 (English version) for Microsoft® Windows® 95/98/Me/NT/2000/XP users.

W_README.txt

W_README.txt is a readme text about this service manual for Windows® user that not installed Adobe® Reader yet.

SERVICE MANUAL

D-STAR REPEATER SYSTEM

ID-RP2

S-14205HZ-C1

Nov. 2005

INTRODUCTION

This service manual describes the latest service information for the **ID-RP2** D-STAR REPEATER SYSTEM at the time of publication.

MODEL	DESCRIPTION		
ID-RP2C	REPEATER CONTROLLER		
ID-RP2L	10GHz MICROWAVE LINK REPEATER		
	Version	TX frequency	RX frequency
	USA	10.150-10.175 GHz	10.000-10.025 GHz
	USA-1	10.000-10.025 GHz	10.150-10.175 GHz
ID-RP2D	1.2 GHz DATA REPEATER		
ID-RP2V	1.2 GHz DIGITAL VOICE REPEATER		

To upgrade quality, any electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-Digit Icom parts number
2. Component name and informations
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1130009850 S.IC TC74LCX245FT ID-RP2C MAIN UNIT 5 pieces
8810002950 Screw BiH M3×6 SUS ID-RP2C Cover 10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 50 dB to 60 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

Icom, Icom Inc. and ICOM logo are registered trademarks of Icom Incorporated (Japan) in the United States, the United Kingdom, Germany, France, Spain, Russia and/or other countries.

------	-----------------	--------

SECTION 1 SPECIFICATIONS

■ GENERAL

- Power supply requirement : 13.8 V DC \pm 15% (Negative ground)
- Current drain : Less than 0.5 A
- Usable temperature range : -10°C to $+50^{\circ}\text{C}$; $+14^{\circ}\text{F}$ to $+122^{\circ}\text{F}$
- Dimensions (proj. not included) : 483(W) \times 44(H) \times 257(D) mm; 19(W) \times 1 $\frac{3}{4}$ (H) \times 10 $\frac{1}{8}$ (D) in.
- Weight (Approx.) : 2.7 kg; 5 lb 15 oz
- Repeater control protocol : Compatible to D-STAR standard

■ LOCAL REPEATER INTERFACE

- Max. number of connections : 4
- Communication speed : Data 128 kbps
Voice 4.8 kbps
- Cable length (approx.) : 3 m; 10 ft (standard; supplied cable of the ID-RP2D/V)

■ ASSIST REPEATER INTERFACE

- Max. number of connections : 2
- Communication speed : Data 10 Mbps
Setting CPU communication 19.2 kbps
- Cable length (approx.) : 30 m; 100 ft (standard; supplied cable of the ID-RP2L)

■ WIRED INTER FACE

- Number of connector : 1
- Type of connection : 10Base-T
- MAC address : Unique ID
- IP address : Programmed with the utility

All stated specifications are subject to change without notice or obligation.

SECTION 2 INSIDE VIEWS

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVED DATA PROCESS

3-1-1 DURING ASSIST REPEATER OPERATION (MAIN UNIT)

The demodulated data signal from the connected ASSIST repeater (ID-RP2L) is applied to [ASSIST-1 A/B] (J13) or [ASSIST-2 A/B] (J12) connector. The demodulated data signal is applied to the LVDS receivers (IC25, IC26) and converted to the I/O signal and then applied to the ASSIST I/F FPGA IC (IC19).

The ASSIST I/F FPGA IC (IC19) converts the applied I/O signal format to the ATM-SAR interface signal format.

The converted ATM-SAR interface signal is applied to the ATM-SAR controller (IC16) and converts the data format into the PCI bus line data format.

The converted data signal is applied to the PCI/DMA FPGA IC (IC15).

3-1-2 DURING LOCAL REPEATER OPERATION (MAIN UNIT)

The demodulated data signal from the connected LOCAL repeater (ID-RP2D or ID-RP2V) is applied to [LOCAL RPT-CONT I/O] connector (J10). The applied signal is amplified at the buffer amplifiers (IC17, IC20, IC21, IC23) and then applied to the LOCAL RPT I/F FPGA IC (IC24).

The LOCAL RPT I/F FPGA (IC24) detects header frame synchronization and then converts the format into the serial data signal.

The converted serial data signal is applied to the PCI/DMA FPGA IC (IC15).

3-1-3 DURING CONNECTED SERVER OPERATION (MAIN UNIT)

The data signal from the connected server is applied to the [10BASE-T] connector (J1) and then applied to the Ethernet controller (IC8). The Ethernet controller (IC8) converts the data format into the PCI bus line data format.

The converted signal is applied to the PCI/DMA FPGA IC (IC15).

3-1-4 SRAM CIRCUIT (MAIN UNIT)

The PCI/DMA FPGA IC bridges the data signal from the ATM-SAR controller (IC16), LOCAL RPT I/F FPGA (IC24) or Ethernet controller (IC8) to the SRAM circuit.

The bridged data signal from the PCI/DMA FPGA IC (IC15) is applied to the SRAM circuit (IC2, IC3, IC6, IC7) and then memorized for transmission.

The bridged data signal from the PCI/DMA FPGA IC (IC15) is also applied to the CPU (IC5) and the CPU analyzes the call sign settings. The CPU (IC5) selects the desired repeater or connected server for transmission according to the analyzed call sign settings.

3-2 TRANSMIT DATA PROCESS

3-2-1 SRAM CIRCUIT (MAIN UNIT)

The memorized data from the SRAM circuit is transferred to the desired repeaters or connected server at the PCI/DMA FPGA IC according to the analyzed call sign settings at the CPU.

The data signal from the SRAM circuit (IC2, IC3, IC6, IC7) is applied to the PCI/DMA FPGA IC (IC15) and the PCI/DMA FPGA IC (IC15) selects one of the ATM-SAR controller (IC16), LOCAL RPT I/F FPGA (IC24) or Ethernet controller (IC8) by the CPU (IC5).

• REPEATER CONTROL CIRCUIT

3-2-2 DURING ASSIST REPEATER OPERATION (MAIN UNIT)

The data signal from the PCI/DMA FPGA IC (IC15) is applied to the ATM-SAR controller (IC16) and converts the signal format into the ATM-SAR interface signal format.

The converted interface signal is applied to the ASSIST I/F FPGA IC (IC19) to convert the signal format into the I/O signal format. The converted I/O signal is applied to the LVDS driver (IC22) and converts the I/O signal format into the differential signal format.

The differential signal is applied to the connected ASSIST repeater (ID-RP2L) via [ASSIST-1 A/B] (J13) or [ASSIST-2 A/B] (J12) connector.

3-2-3 DURING LOCAL REPEATER OPERATION (MAIN UNIT)

The data signal from the PCI/DMA FPGA IC (IC15) is applied to the LOCAL RPT I/F FPGA IC (IC24) and converts the signal format into the parallel data signal format.

The converted parallel data signal is applied to the buffer amplifiers (IC17, IC20, IC21, IC23) and then applied to the connected LOCAL repeater (ID-RP2D or ID-RP2V) via [LOCAL RPT CONT I/O] connector (J10).

3-2-4 DURING CONNECTED SERVER OPERATION (MAIN UNIT)

The data signal from the PCI/DMA FPGA IC (IC15) is applied to the Ethernet controller (IC8) and converts the data format into the Ethernet data format.

The converted Ethernet data is applied to the connected server via [10BASE-T] connector (J1).

3-3 POWER SUPPLY CIRCUITS

Line	Description
3.3 V	Common 3.3 V converted from the 13.8 V line by the 3.3 V regulator circuit (IC13). The output voltage is applied to the SRAM ICs (IC2, IC3, IC6, IC7), ATM-SAR controller (IC16), etc.
1.8 V	Common 1.8 V converted from the 3.3 V line by the 1.8 V regulator circuit (IC33). The output voltage is applied to the CPU (IC5).
1.5 V	Common 1.5 V converted from the 3.3 V line by the 1.5 V regulator circuit (IC34). The output voltage is applied to the ASSIST I/F FPGA IC (IC19), LOCAL RPT I/F FPGA IC (IC24), etc.

3-4 OTHER CIRCUITS

• REPEATER CONTROL CIRCUITS (MAIN UNIT)

The repeater control circuits consist of the CPU (IC5), Boot ROM (IC12), Flash ROM (IC11), SRAM (IC2, IC3, IC6, IC7).

A 32-bit processor is adopted as the CPU (IC5), and the 22 MHz signal, generated by the clock oscillator (X2), is used for the CPU clock after being multiplied by 6 at the inside the CPU.

The Boot ROM (IC12) is 16 M-bit flash memory as 8 bits each.

The Flash ROM (IC11) is 32 M-bit flash memory as 16 bits each.

The SRAM circuit (IC2, IC3, IC6, IC7) contains four 4 M-bit SRAM IC as 32 bits each.

• 33 MHz CLOCK CIRCUIT (MAIN UNIT)

The 22 MHz clock signal is multiplied by $\frac{3}{2}$ at the inside of the CPU (IC5) and then amplified at the clock driver (IC15).

The amplified clock signal is applied to the PCI/DMA FPGA IC (IC15), Ethernet controller (IC8), ATM-SAR controller (IC16).

• USB CONTROLLER (MAIN UNIT)

While setting the ASSIST repeater (ID-RP2L), the USB controllers are used for communication with the connected PC.

While reading the setting data from the connected ASSIST repeater (ID-RP2L), the setting data is applied to the LVDS receivers (IC25, IC26) in the differential data format. The applied data format is converted into the serial data format at the LVDS receivers (IC25, IC26).

The converted serial data is applied to the USB controllers (IC27, IC28) to be converted into the USB data format. The converted USB data is applied to the connected PC via [SERVICE 1] (J19) or [SERVICE 2] (J20) connector.

While writing the setting data to the connected ASSIST repeater (ID-RP2L), the setting data is applied to the USB controllers (IC25, IC26) via [SERVICE 1] (J19) or [SERVICE 2] (J20) connector. The USB controllers (IC25, IC26) convert the applied data format into the serial data format.

The converted serial data is applied to the LVDS driver (IC22) and converted into the differential data format. The converted differential data is applied to the connected ASSIST repeater (ID-RP2L).

SECTION 1 SPECIFICATIONS

■ GENERAL

• Frequency range	: Receive	USA	10.000–10.025 GHz
		USA-1	10.150–10.175 GHz
	: Transmit	USA	10.150–10.175 GHz
		USA-1	10.000–10.025 GHz
• Type of emission	: F1D* (GMSK)		
			*F7W for system operation (with ID-RP2C)
• Frequency stability	: ±5 ppm	(based on 25°C; +77°F)	
• Frequency resolution	: 250 kHz		
• Antenna connector	: Type-N (50 Ω)		
• Communication speed	: 10 Mbps		
• Power supply requirement	: 13.8 V DC ±15%	(Negative ground)	
• Current drain	: Transmit	Less than 2.3 A	
	: Stand-by	Less than 0.7 A	
• Usable temperature range	: –30°C to +60°C; –22°F to +140°F		
• Dimensions (proj. not included)	: 328(W)×262(H)×116(D) mm; 12 ²⁹ / ₃₂ (W)×10 ⁵ / ₁₆ (H)×4 ⁹ / ₁₆ (D) in.		
• Weight (Approx.; incl. cables)	: 14.6 kg; 32 lb 3 oz		

■ TRANSMITTER

• Output power (at 13.8 V DC)	: 2.0 W
• Modulation system	: Quadrature (525.75 MHz)
• Occupied bandwidth	: Less than 10.5 MHz
• Spurious emissions	: Less than 100 μW

■ RECEIVER

• Receive system	: Double-conversion superheterodyne system
• Intermediate frequencies	: 1st 1747.5 MHz
	: 2nd 374 MHz
• Sensitivity (BER 1×10 ⁻²)	: Less than –78 dBm
• Selectivity	: More than 1 MHz/6 dB
	: Less than 1.5 MHz/40 dB
• Receive spurious	: Less than –57 dBm

All stated specifications are subject to change without notice or obligation.

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 RF CIRCUIT (10 GHz MODULE)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals. And converts the filtered signals to the fixed frequency of the 1st IF signal.

The signals from the antenna are applied to [ANT] connector (CHASSIS unit; W1) and then passed through the duplexer unit (CHASSIS unit; FI1). The received signals from the duplexer are amplified at 2 RF amplifiers in the 10 GHz module and then passed through the bandpass filter. The filtered signals are mixed with the 1st LO signal coming from the RX VCO circuit in the 10 GHz module to produce the 1747.5 MHz 1st IF signal. The 1st IF signal passes through the bandpass filter to suppress out-of-band signals.

The filtered signal is applied to the IF circuit (IF unit).

3-1-2 IF CIRCUITS (IF UNIT)

The IF circuit converts the 1st IF signal to the 2nd IF signal with the PLL output frequency.

The 1st IF signal from the 10 GHz module is applied to the level adjust section of the IF converter (IC404, pin 4) and output from pin 61 (IC404). The level adjusted signal is passed through the bandpass filter (FI402) and then applied to the mixer section of the IF converter (IC404, pin 52). The applied signal is mixed with the 2nd LO signal coming from the RX 2nd VCO circuit (Q404, Q405, D402) via the doubler circuit (Q406) to convert to a 374 MHz 2nd IF signal.

The 2nd IF signal is output from pins 48 and 49 of the IF converter (IC404) and then applied to the level adjust section of the I/Q demodulator (IC401, pins 3, 4) via the bandpass filter (FI403). The level adjusted signal is mixed with the 3rd LO signal coming from the RX 3rd VCO circuit (Q401, Q402, D401) at the demodulator section (IC401, pins 3, 4) to demodulate the I/Q signals.

The demodulated I/Q signals are output from pins 37 and 38 (IC401; for I signals), and pins 35 and 36 (IC401; for Q signals) and are applied to the A/D converter.

3-1-3 FPGA CIRCUIT (IF UNIT)

The demodulated I/Q signals from the I/Q demodulator (IC401) are applied to the A/D converter (IC9, pins 2, 3 for I signals, pins 10, 11 for Q signals) to convert to 5-bit digital I/Q signals, and output from pins 40–44 (IC9; for I signals) and pins 17–21 (IC9; for Q signals).

The digital I/Q signals are applied to the FM detector section of the FPGA IC (IC11, pins 7–11 for I signals, pins 17–21 for Q signals) and output from pins 140–144 (IC11). The detected signals are applied to the D/A converter (R121–R136) and I/Q filter (L23–L28, C123, C125, C126, C128, C129) to convert to analog FM demodulated signal.

The analog FM demodulated signal is applied to the clock recovery circuit (IC15, IC17, IC21, IC523) to recover the clock and data signals. The recovered clock and data signals are applied to the latch section of FPGA IC (IC11, pins 135, 136) and then output from pins 27 and 28. The RX clock (RX_CLK) and RX data (RX_DAT) signals are applied to the TX LVDS controller (IC514) to convert to differential signal and then applied to the connected repeater controller (ID-RP2C) via [DATA B] that is connected to J9.

• RF AND IF CIRCUITS (RECEIVER)

3-2 TRANSMITTER CIRCUITS

3-2-1 FPGA CIRCUIT (IF UNIT)

The TX data signal (10 Mbps) from the connected repeater controller (ID-RP2C) is applied to the RX LVDS controller (IC513) via [DATA A] that is connected to J2. The TX data signals are converted differential signals to I/Q signals at the RX LVDS controller (IC513). The converted signals from the RX LVDS controller (IC513, pin 3) is applied to the baseband section of the FPGA IC (IC11, pin 27) and then applied to the D/A converters (R18–R39 for I signals, R41–R62 for Q signals) and I/Q filters (L10–L15, C29, C31, C32, C34, C35 for I signals, L17–L21, C37, C39, C40, C42, C43 for Q signals) to convert to I/Q baseband signals.

The converted I/Q baseband signals are applied to the I/Q modulation circuit.

3-2-2 MODULATION CIRCUIT (IF UNIT)

The modulation circuit modulates the VCO oscillating signal using the I/Q baseband signals.

The I/Q baseband signals are applied to the I/Q modulator section of the I/Q modulator (IC201, pin 34 for I signal, pin 31 for Q signal) and then modulates the 3rd LO signal coming from the TX 3rd VCO circuit (Q201, Q202, D201) via the tripler circuit (Q203). The modulated signals (2nd IF signals) are output from pins 8 and 9 (IC201) via the level adjust section.

The 2nd IF signals are amplified at Q209 and are then applied to the mixer section of the IF converter IC (IC204, pins 47, 50). The applied signals are mixed with the 2nd LO signal coming from the TX 2nd VCO circuit (Q204, Q205, D203) via the tripler circuit (Q206) to convert to a 2332.5 MHz 1st IF signal. The 1st IF signal is output from pin 34 (IC204) and then passed through the bandpass filter (FI202). The filtered

signal is applied to the level adjust section of the IF converter (IC204, pin 19) and then output from pin 13 (IC204).

The level adjusted signal is passed through the bandpass filter (FI203) to suppress unwanted signals and then applied to the 10 GHz module via J201.

3-2-3 RF CIRCUIT (10 GHz MODULE)

The RF circuit converts the 1st IF signal to the RF signal and amplifies output power level.

The 2332.5 MHz 1st IF signal from the IF unit is passed through the bandpass, low-pass filters and attenuator, and then mixed with the 1st LO signal coming from the TX VCO circuit in the 10 GHz module to convert to the RF signal. The RF signal is amplified at 2 driver and 5 power amplifiers to produce 2 W output power.

The power amplified signal is applied to the antenna connector via the duplexer unit.

3-3 PLL CIRCUITS

3-3-1 PLL CIRCUITS (IF UNIT)

The PLL circuit provides stable oscillation of the RX 2nd LO, RX 3rd LO, TX 2nd LO and TX 3rd LO frequencies.

3-3-2 RX 2ND PLL CIRCUIT (IF UNIT)

The RX 2nd PLL circuit oscillates the RX 2nd LO frequency, and the signal is applied to the 2nd mixer section in the IF converter IC (IC404).

The oscillated signal from the RX 2nd VCO (Q404, Q405, D402) is applied to the doubler circuit (Q406) and is then applied to the 2nd mixer section in the IF converter IC (IC404, pin 40).

• RF AND IF CIRCUITS (TRANSMITTER)

10.000–10.025 GHz
10.015–10.175 GHz

The portion of the signal is applied to the PLL section as the comparison signal. The PLL section compares the phase of divided VCO frequency to the reference frequency (X204; 25 MHz). The output signal from the PLL section (IC404, pin 30) is passed through the loop filter and is then applied to the RX 2nd VCO circuit.

The portion of the signal is applied to the PLL section as the comparison signal. The PLL section compares the phase of divided VCO frequency to the reference frequency (X204; 25 MHz). The output signal from the PLL section (IC201, pin 22) is passed through the loop filter and is then applied to the TX 3rd VCO circuit.

3-3-3 RX 3RD PLL CIRCUIT (IF UNIT)

The RX 3rd PLL circuit oscillates the RX 3rd LO frequency and the signal is applied to the 3rd mixer section in the I/Q demodulator IC (IC401).

3-3-5 TX 2ND PLL CIRCUIT (IF UNIT)

The 2nd PLL circuit oscillates the TX 2nd LO frequency and the signal is applied to the 2nd mixer section in the IF converter (IC204).

The oscillated signal from the RX 3rd VCO circuit (Q401, Q402, D401) is amplified at the buffer amplifier (Q403) and then applied to the 3rd mixer section of the I/Q demodulator IC (IC401, pin 26).

The oscillated signal from the TX 2nd VCO circuit (Q204, Q205, D204) is applied to the tripler circuit (Q206) and then applied to the 2nd mixer section of IF converter (IC204, pin 40).

The portion of the signal is applied to the PLL section as the comparison signal. The PLL section compares the phase of divided VCO frequency to the reference frequency (X204; 25 MHz). The output signal from the PLL section (IC401, pin 22) is passed through the loop filter and is then applied to the RX 3rd VCO circuit.

The portion of the signal is applied to the PLL section as the comparison signal. The PLL section compares the phase of divided VCO frequency to the reference frequency (X204; 25 MHz). The output signal from the PLL section (IC204, pin 30) is passed through the loop filter and is then applied to the TX 2nd VCO circuit.

3-3-4 TX 3RD PLL CIRCUIT (IF UNIT)

The 3rd PLL circuit oscillates the TX 3rd LO frequency and the signal is applied to the 3rd mixer section in the I/Q modulator (IC201).

3-4 POWER SUPPLY CIRCUITS

The oscillated signal from the TX 3rd VCO circuit (Q201, Q202, D201) is applied to the tripler circuit (Q203) and then applied to the 3rd mixer section of the I/Q modulator (IC201, pin 26).

Line	Description
5 V	Common 5 V controlled by the +5 V regulator circuit (IC1). The output voltage is applied to the baseband clock circuit (Q1, X1), etc.
3.3 V	Common 3.3 V converted from the 5V line by the 3.3 V regulator circuit (IC12). The output voltage is applied to the FPGA IC (IC11) and A/D converter (IC9), etc.
2.5 V	Common 2.5 V converted from the 5V line by the 2.5 V regulator circuit (IC13). The output voltage is applied to the FPGA IC (IC11), etc.

SECTION 4 ADJUSTMENT PROCEDURES

4-1 PREPARATION

When adjusting ID-RP2L, ID-RP2C REPEATER CONTROLLER, UTILITY SOFTWARE (Rev. 1.0 or more), USB cable (A-B type) and the test plug are required.

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 10 A or more	Attenuator	Power attenuation : 40 or 50 dB Capacity : 10 W
Modulation analyzer	Frequency range : DC–10.5 GHz Measuring range : 0 to ± 10 kHz	Oscilloscope	Frequency rang : DC–20 MHz Measuring range : 0.01–20 V
Frequency counter	Frequency range : 1 MHz to 10.5 GHz Frequency accuracy : ± 1 ppm or better Sensitivity : 100 mV or better	Standard signal generator (SSG)	Frequency range : 0.1–10.5 GHz Output level : 0.1 μ V to 71 mV (–127 to –10 dBm)
RF power meter	Measuring range : 1–5 W Frequency range : 10–10.5 GHz Impedance : 50 Ω SWR : Better than 1.2 : 1	Spectrum analyzer	Frequency range : At least 10.5 GHz Spectrum bandwidth : 100 kHz or more
		Digital multimeter	Input impedance : 10 M Ω /V DC or more

■ SYSTEM REQUIREMENTS

- Microsoft® Windows® 98/98SE/Me/2000/XP
- USB port

■ BEFORE STARTING ADJUSTMENT

Program the adjustment frequencies (see adjustment frequency list) into the repeater using with the utility software before starting the adjustment. Otherwise, the repeater cannot be adjusted properly.

CAUTION!: BACK UP the originally programmed memory data in the repeater before programming the adjustment frequencies.

When program the adjustment frequencies into the repeater, the repeater's memory data will be overwritten and lose original memory data at the same time.

SECTION 1 SPECIFICATIONS

■ GENERAL

• Frequency range	: Transmit	1240.000–1300.000 MHz
	Receive	1240.000–1300.000 MHz
• Type of emission	: F1D (GMSK)	
• Communication speed	: 128 kbps	
• Frequency stability	: ± 2.5 ppm (based on 25°C; +77°F)	
• Frequency resolutions	: 5, 6.25 kHz	
• Usable temperature range	: –10°C to +50°C; +14°F to +122°F	
• Antenna connector	: Type-N (50 Ω)	
• Power supply requirement	: 13.8 V DC $\pm 15\%$ (Negative ground)	
• Current drain	: Transmit (High)	Less than 6.0 A
	(Low)	Less than 2.7 A
	Receive (Stand-by)	Less than 0.7 A
• Dimensions (proj. not included)	: 483(W) \times 88(H) \times 428(D) mm; 19(W) \times 3 ^{15/32} (H) \times 16 ^{27/32} (D) in.	
• Weight (Approx.)	: 6.2 kg; 13 lb 10 oz	

■ TRANSMITTER

• Output power (at 13.8 V DC)	: High	9–12 W
	Low	0.5–1.2 W
• Modulation system	: Quadrature (243.95 MHz)	
• Occupied bandwidth	: Less than 130 kHz	
• Spurious emissions	: Less than –50 dB	

■ RECEIVER

• Receive system	: Double-conversion superheterodyne
• Intermediate frequencies	: 1st 243.95 MHz
	2nd 10.7 MHz
• Sensitivity (BER 1×10^{-2})	: Less than +7 dB μ (2.24 μ V)
• Selectivity	: More than 140 kHz/6 dB
	Less than 520 kHz/40 dB
• Spurious and image rejection	: More than 60 dB (General)
	More than 50 dB (IF, $1F/2$)
• Receive spurious	: Less than –57 dBm

All stated specifications are subject to change without notice or obligation.

SECTION 3 DISASSEMBLY INSTRUCTIONS

• REMOVING THE COVER

- ① Unscrew 12 screws (A), and remove the cover (B).
- ② Disconnect the cable (C), and disconnect the cable (D).

• REMOVING THE LOGIC-D UNIT

- ① Unscrew 1 screw (A), and remove the cover (B).
- ② Remove 2 main shield plates (C).
- ③ Disconnect 2 cables (D), and unsolder 1 point (E).
- ④ Unscrew 4 screws (F), and remove the earth spring (G).
- ⑤ Take off the LOGIC-D unit.

• REMOVING THE MAIN-D UNIT

- ① Unsolder 5 points (A), and remove the ANT plate (B).

- ② Unsolder 12 points (C).
- ③ Unscrew 2 screws (D), and remove the ANT connector (E).
- ④ Take off the cable (F) from the chassis.
- ⑤ Disconnect the cable (G).
- ⑥ Unscrew 7 screws (H), and take off the MAIN-D unit.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT (MAIN-D UNIT)

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. This circuit does not allow transmit signals to enter the receiver circuits.

Received signals from the antenna connector (CASE; W4) are applied to the MAIN-D unit via J1 (CHASSIS-D). The applied signals are passed through the low-pass filter which contains strip-line and C1198, and are then applied to the $\frac{1}{4}$ type antenna switching circuit (D1161–D1162, L1162).

While receiving, no voltage is applied to D1161–D1162. Thus, the receive line and ground are disconnected and received signals are applied to the RF circuit.

ID-RP2D's transmitting and receiving are different timing.

4-1-2 RF CIRCUIT (MAIN-D UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit pass through the high-pass filter (L1–L4, C2–C5) and then applied to the RF amplifier (Q1). The amplified signals are passed through the bandpass filters (FI1, FI2) to suppress unwanted signals.

The filtered signals are applied to the 1st mixer circuit.

4-1-3 1ST MIXER AND 1ST IF CIRCUITS (MAIN-D UNIT)

The 1st mixer circuit converts the received signals into fixed frequency of the 1st IF signal with the 1st LO signal. By changing the 1st LO signal, only the desired frequency passes through the bandpass filter at the next stage of the 1st mixer circuit.

The RF signals from the bandpass filter (FI2) are mixed with the 1st LO signal, where come from the 1st VCO circuit (Q471, Q472, D471), at the 1st mixer circuit (IC71) to produce a 243.95 MHz 1st IF signal. The 1st IF signal is passed through the bandpass filter (FI71) to suppress unwanted signals and pass only the desired signals.

The filtered signal is applied to the 2nd IF circuit.

4-1-4 2ND MIXER AND 2ND IF CIRCUITS (MAIN-D UNIT)

The 2nd mixer circuit converts the 1st IF signal into the 2nd IF signal with the 2nd LO signal.

The filtered 1st IF signal from the bandpass filter (FI71) is mixed with the 2nd LO signal (233.25 MHz), where come from the 2nd VCO circuit (Q631, D630), at the 2nd mixer circuit (Q131) to produce a 2nd IF signal (10.7 MHz). The 2nd IF signal is passed through the bandpass filter (FI272) to remove unwanted heterodyned frequencies via the mode switch (D273). The filtered signal is amplified at the IF amplifier (Q270) and then passed through another bandpass filter (FI273). The filtered signal is applied to another IF amplifier (Q271) and then applied to the MSK receiver (IC271).

• RF AND IF CIRCUITS

4-1-5 DEMODULATOR CIRCUITS (MAIN-D UNIT)

The MSK receiver IC (IC271) contains the limiter amplifier, quadrature detector, etc.

The amplified 2nd IF signal from the IF amplifier (Q271) is applied to the limiter amplifier section of the MSK receiver (IC271, pin 7) and then applied to the quadrature detector section (IC271, pin 11) to demodulate to the data signals.

The demodulated data signals are output from pin 13 of the MSK receiver (IC271) and are amplified at IC343 (pins 1, 2). The amplified signals are switched at the mode switch (IC342, pins 1, 6) and then applied to the LOGIC-D unit via J1801 (pin 20).

4-1-6 DIGITAL CIRCUITS (LOGIC-D UNIT)

The digital circuits convert the demodulated data signals format for communication to the repeater controller (ID-RP2C).

The demodulated data signals from the mode switch (MAIN-D unit: IC342, pin 1) are applied to the GMSK MODEM (IC150, pin 11). The applied signals are synchronized with the clock signal, then the synchronized signals are applied to the CPU (IC50) via the FPGA IC (IC200).

The output signals from the CPU (IC50) are applied to the buffer amplifier (IC901) and then applied to the REAR unit via J901.

The amplified signals are applied to the connected repeater controller (ID-RP2C) via [CONT I/O] (REAR unit; J2).

4-2 TRANSMITTER CIRCUITS

4-2-1 DIGITAL CIRCUITS (LOGIC-D UNIT)

The digital circuits convert the data signals form for transmit.

The data signals from the connected repeater controller (ID-RP2C) are applied to the buffer amplifier (IC901) and then applied to the CPU (IC50) via [CONT I/O] (REAR unit; J2).

The applied data signals to the CPU (IC50) are processed and then applied to the FPGA IC (IC200) to split to the I and Q baseband signals for quadrature modulation. The I/Q baseband signals output from pins 75–80, 82–89, 92–99 (IC200) and then applied to the D/A converters (R250–R293).

The converted signals are passed through the baseband filter (IC300–IC302) and then applied to the MAIN-D unit via J400 (pins 1, 3).

4-2-3 MODULATION CIRCUIT (MAIN-D UNIT)

The modulation circuit modulates the 2nd LO signal at the quadrature modulation circuit (IC890) using the I/Q baseband signals.

The I/Q baseband signals from the LOGIC-D unit are amplified at the I/Q baseband amplifiers (IC832, pins 1, 2, 6, 7) and then applied to the amplifier section of the quadrature modulator (IC890, pins 4, 7). The 2nd LO signal is also applied to the $\pm 45^\circ$ phase splitter section of the quadrature modulator (IC890, pin 8) and then the $\pm 45^\circ$ phase shifted and split LO signals are applied to the LO amplifier sections. The amplified LO signals are modulated with the I/Q baseband signals at the I/Q modulator sections and then combined at combining amplifier section. The modulated signal is output from pin 14 (IC890) after amplified at the RF amplifier section.

The modulated signal is passed through the bandpass (FI880) and low-pass (L892, L893, C904–C908) filters and then applied to the 1st mixer circuit.

• DIGITAL CIRCUITS

4-2-4 1ST MIXER CIRCUITS (MAIN-D UNIT)

The 1st mixer circuits convert to the RF signal with the 1st LO signal.

The filtered signal from the low-pass filter (L892, L893, C904 –C908) is applied to the 1st mixer circuit (IC960, pins 1, 6). The applied signal is mixed with the 1st LO signal coming from the 1st VCO circuit (Q471, Q472, D471) via the buffer amplifiers (Q473, Q710) to convert into the RF signal. The RF signal from the 1st mixer circuit (IC960, pin 6) is passed through the bandpass filter (F1961) and then amplified at the RF amplifier (IC1021).

The amplified signal is passed through the bandpass filter (F11020) to suppress spurious components and then applied to the drive/power amplifier circuits.

4-2-5 DRIVE/POWER AMPLIFIER CIRCUITS (MAIN-D UNIT)

The drive/power amplifier circuits amplify the RF signal to the output level.

The filtered RF signal from the bandpass filter (F11020) is amplified at the pre-drive (Q1080), drive (Q1081) and power (IC1160) amplifiers to obtain a stable 10 W of output power.

The power amplified signal from the power amplifier (IC1160, pin 4) is passed through the antenna switch (D1160), SWR detector circuit (D1166, D1167), low-pass filter which contains strip-line and C1198, and then applied to the antenna connector (CASE; W4) via J1 (CHASSIS-D).

4-2-6 APC CIRCUIT (MAIN-D UNIT)

The APC circuit protects the driver and power amplifiers from a mismatched output load and stabilizes the output power.

The SWR detector circuit (D1166, D1167) detects the forward signals and reflection signals, and converts it into DC voltage. The output voltage is at a minimum level when the antenna impedance is matched with 50 Ω and is increased when it is mismatched.

The detected voltage is applied to the APC amplifier (IC1250, pins 3, 4) and is compared with the reference voltage which is supplied from the CPU (LOGIC-D unit: IC50, pin 85) as "PCON" signal.

When antenna impedance is mismatched, the detected voltage exceeds the power setting voltage. The output voltage of the APC amplifiers (IC1250, IC1251) controls the bias voltage of the drive amplifiers (Q1080, Q1081) and to reduce the output power.

4-3 PLL CIRCUITS

4-3-1 PLL CIRCUITS (MAIN-D UNIT)

The PLL circuit provides stable oscillation of the 1st LO frequencies and 2nd LO frequency. The PLL output compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by the divided ratio (N-data) of a programmable divider.

4-3-2 1ST PLL CIRCUIT (MAIN-D UNIT)

The 1st PLL circuit oscillates the 1st LO frequencies, and signals are applied to the 1st mixer circuits. The oscillated signals from the 1st VCO circuit (Q471, Q472, D471) are applied to the buffer amplifiers (Q473, Q474) and are then applied to the PLL IC (IC400, pin 6).

The PLL IC contains a prescaler, programmable counter, programmable divider and phase detector, etc.

The applied signal is divided at the prescaler and programmable counter section by the N-data ratio from the CPU (LOGIC-D unit; IC50). The divided signal is detected on phase at the phase detector using the reference frequency (X400: 15.3 MHz) and output from pin 4 (IC400). The output signal is passed through the loop filter and is then applied to the 1st VCO circuit.

• APC CIRCUIT

The oscillated signal at the 1st VCO is buffer amplified at Q473 and then passed through the bandpass filter (L474–L477, C488–C497).

The filtered signal is applied to the buffer amplifier (Q710) and then applied to the T/R switch (D710, D711).

The receive 1st LO signal from the T/R switch (D711) is applied to the 1st mixer circuit (IC71).

The transmit signal from the T/R switch (D710) is applied to the 1st mixer circuit (IC960).

4-3-3 2ND PLL CIRCUIT (MAIN-D UNIT)

The 2nd PLL circuit oscillates the 2nd LO frequency, and the signal is applied to the 2nd mixer circuit and quadrature modulator.

The signal oscillated at the 2nd VCO circuit (Q631, D630) is amplified at the buffer amplifiers (Q632, Q633), then applied to the PLL IC (IC550, pin 19). The applied signal is divided at the prescaler and programmable counter section by the N-data ratio from the CPU (LOGIC-D unit; IC50). The divided signal is detected on phase at the phase detector using the reference frequency (X400: 15.3 MHz) and output from pin 13 (IC550). The detected signal is passed through the loop filter (R555–R557, C564, C567) and then applied to the 2nd VCO circuit via the mode switch (IC551, pins 1, 7).

The oscillated signal at the 2nd VCO is amplified at the buffer amplifiers (Q632 Q771), and is then applied to the T/R switch (D770, D771).

The receive 2nd LO signal from the T/R switch (D771) is applied to the 2nd mixer circuit (Q131).

The transmit signal from the T/R switch (D770) is applied to the quadrature modulator (IC890).

4-4 POWER SUPPLY CIRCUITS
4-4-1 LOGIC-D UNIT VOLTAGE LINE

Line	Description
5V	Common 5 V controlled by the +5 V regulator circuit (IC500, Q500, Q501) using the “PWRS” signal from the CPU (IC50, pin 101). The output voltage is applied to the baseband filters (IC300–302), etc.
3.3V	Common 3.3 V converted from the 5V line by the 3.3V regulator circuit (IC502). The output voltage is applied to the FPGA IC (IC200) and buffer amplifier (IC901), etc.
3.3V	Common 3.3 V converted from the 5V line by the 3.3V regulator circuit (IC504). The output voltage is applied to the CPU (IC50) and A/D converter (IC55), etc.

• **PLL CIRCUIT**

4-5 PORT ALLOCATIONS

4-5-1 CPU (LOGIC-D UNIT; IC50)

4-4-2 MAIN-D UNIT VOLTAGE LINE

Line	Description
HV	The voltage from a DC power supply.
VCC	The same voltage as the HV line which is controlled by the power switching circuit (Q23, Q24). When the power switch is pushed, the CPU outputs the "PWR" control signal to the power switching circuit to turn the circuit ON.
+9	Common 9 V converted from the HV line at the +9 CTRL circuit (IC1330). The output voltage is applied to the 1st VCO (Q471), etc.
+5	Common 5 V converted from the +9V line at the 5 V regulator circuit (IC1331). The output voltage is applied to the APC amplifier (IC1251) and buffer amplifier (Q710), etc.
DM+5	Common 5 V converted from the +9V line at the 5 V regulator circuit (IC830). The output voltage is applied to the modulation amplifiers (IC831, IC832), etc.
T+9	Transmit 9 V controlled by the T+9 regulator circuit (Q1333, Q1334, D1331) using the "TXS" signal from the CPU (LOGIC-D unit; IC50, pin 94). The output voltage is applied to the APC amplifier (IC1250), etc.
T+5	Transmit 5 V controlled by the T+5 regulator circuit (Q1336, D1332, D1333) using the "TXS" signal from the CPU (LOGIC-D unit; IC50, pin 94). The output voltage is applied to the RF amplifier (IC1021), etc.
R+5	Receive 5 V controlled by the R+5 regulator circuit (Q1337) using the "RXS" signal from the CPU (LOGIC-D unit; IC50, pin 95). The output voltage is applied to the RF amplifier (Q2) and 1st mixer (IC71), etc.
T+3	Transmit 3 V controlled by the T+3 regulator circuit (Q1342) using the "TXS" signal from the CPU (LOGIC-D unit; IC50, pin 94). The output voltage is applied to the 1st mixer (IC960), etc.
R+3	Receive 3 V controlled by the R+3 regulator circuit (Q1343) using the "RXS" signal from the CPU (LOGIC-D unit; IC50, pin 95). The output voltage is applied to the RF amplifier (Q1), etc.

Pin number	Port name	Description
42	TXD1	Output data signals to the USB controller (IC550, pin 24).
43	RXD1	Input port for data signals from the USB controller (IC550, pin 25) via the (IC553).
53	SDA	I/O port for data signals from/to the EEPROM (IC54, pin 5).
54	SCL	Outputs clock signal to the EEPROM (IC54, pin 6).
71	RESET	Input port for reset signal from the reset IC (IC52, pin 1).
72	P2RSC	Outputs control signal to the mode switch (MAIN-D unit; IC551, pin 5) via the level converter (IC55).
73	P2STC	Outputs strobe signal to the 2nd PLL IC (MAIN-D unit; IC550, pin 3) via the level converter (IC55).
74	PDATC	Outputs the data signal to the 1st and 2nd PLL ICs (MAIN-D unit; IC400, pin 15, IC550, pin 5) via the level converter (IC55).
75	PSCKC	Outputs clock signal to the 1st and 2nd PLL ICs (MAIN-D unit; IC400, pin 14, IC550, pin 4) via the level converter (IC55).
76	P1STC	Outputs strobe signal to the 1st PLL IC (MAIN-D unit; IC400, pin 16) via the level converter (IC55).
77	+5AC	Outputs control signal to the 5A (Q1345) and D+5 (Q1347) regulators via the level converter (IC55). Low: While the +5 and D+5 regulators are activated.
85	PCON	Outputs control signal to the TX power controller (MAIN-D unit; Q1250).
86	ULCK	Input port for the PLL unlock signal. High: The PLL circuit is unlocked.
94	TXS	Outputs the T+5, T+3 regulator circuits (MAIN-D unit; Q1336, Q1342) control signal. High: During transmit.
95	RXS	Outputs the R+5, R+3 regulator circuits (MAIN-D unit; Q1337, Q1343) control signal. High: During receive.

Pin number	Port name	Description
103	AFCSW	Outputs AFC switch (IC352, pin 5) control signal.
105	DACK2	Outputs clock signal to the D/A converter (IC57, pin 7).
106	DADAT2	Outputs the data signal to the D/A converter (IC57, pin 6).
107	DACK1	Outputs clock signal to the D/A converter (IC56, pin 7).
108	DADAT1	Outputs the data signal to the D/A converter (IC56, pin 6).
128	FSTB	Outputs strobe signal to the FPGA IC (IC200).
129	MSTRC	Outputs strobe signal to the liner CODEC IC (IC1) and FPGA IC (IC200).
130	MDATC	Outputs the data signal to the liner CODEC IC (IC1) and FPGA IC (IC200).
131	MCLKC	Outputs clock signal to the liner CODEC IC (IC1) and FPGA IC (IC200).
132	MRESC	Outputs reset signal to the liner CODEC IC (IC1) and FPGA IC (IC200).

SECTION 5 PARTS LIST

[MAIN-D UNIT]

REF NO.	ORDER NO.	DESCRIPTION	M.	H/V LOCATION

SECTION 1 SPECIFICATIONS

■ GENERAL

• Frequency range	: Transmit 1240.000–1300.000 MHz Receive 1240.000–1300.000 MHz
• Type of emission	: F1D* (GMSK) *F7W for system operation
• Communication speed	: 4.8 kbps
• Frequency resolutions	: 5, 6.25 kHz
• Frequency stability	: ± 2.5 ppm (based on 25°C; +77°F)
• Usable temperature range	: –10°C to +50°C; +14°F to +122°F
• Antenna connectors	: Type-N (50 Ω) \times 2
• Power supply requirement	: 13.8 V DC \pm 15% (Negative ground)
• Current drain	: Transmit (High) Less than 7.0 A (Low) Less than 3.0 A Receive (Stand-by) Less than 1.0 A
• Dimensions (proj. not included)	: 483(W) \times 88(H) \times 428(D) mm; 19(W) \times 3 ¹⁵ / ₃₂ (H) \times 16 ²⁷ / ₃₂ (D) in
• Weight (Approx.)	: 7.5 kg; 16 lb 9 oz

■ TRANSMITTER

• Output power (at 13.8 V DC)	: High 6–12 W Low 0.5–1.2 W
• Modulation system	: Quadrature (243.95 MHz)
• Occupied bandwidth	: Less than 5.5 kHz
• Spurious emissions	: Less than –50 dB

■ RECEIVER

• Receive system	: Triple-conversion superheterodyne system
• Intermediate frequencies	: 1st 243.95 MHz 2nd 31.05 MHz 3rd 450 kHz
• Sensitivity (BER 1×10^{-2})	: Less than –7 dB μ (0.45 μ V)
• Selectivity	: More than 6 kHz/6 dB Less than 18 kHz/50 dB
• Spurious and image rejection	: More than 60 dB (General) More than 50 dB (IF, IF/2)
• Receive spurious	: Less than –57 dBm

All stated specifications are subject to change without notice or obligation.

SECTION 3 DISASSEMBLY INSTRUCTIONS

● REMOVING THE COVER

- ① Unscrew 12 screws (A), and remove the cover (B).
- ② Disconnect 2 cables (C), and disconnect 2 cables (D).

● REMOVING THE LOGIC-T/R UNIT

- ① Unscrew 1 screw (A), and remove the cover (B).
- ② Remove 2 main shield plates (C).
- ③ Disconnect 2 cables (D), and unsolder 1 point (E).
- ④ Unscrew 4 screws (F), and remove the earth spring (G).
- ⑤ Take off the LOGIC-T/R unit.

● REMOVING THE MAIN-T/R UNIT

- ① Unsolder 2 points (A). (MAIN-T unit only)
- ② Unsolder 3 points (B), and remove the ANT plate (C).

- ③ Unsolder 8 points (D). (MAIN-T unit only)
- ④ Unsolder 3 points (E).
- ⑤ Unscrew 2 screws (F), and remove the ANT connector (G).
- ⑥ Take off the cable (H) from the chassis.
- ⑦ Disconnect the cable (I). (MAIN-T unit only)
- ⑧ Unscrew 7 screws (J), and take off the MAIN-T/R unit.

SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 RF CIRCUIT (MAIN-R UNIT)

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The received signals from the receive antenna connector (CASE; W6) are applied to the MAIN-R unit via J1 (CHASSIS-R). The applied signals are passed through the low-pass filter which contains strip-line, L1162, L1193, C1189, C1198, C9202 and C9203. The filtered signals are through the high-pass filter (L1–L4, C2–C5) and then applied to the RF amplifier (Q1). The amplified signals are passed through the bandpass filter (F1) and then applied to another RF amplifier (Q2). The amplified signals are passed through another bandpass filter (F2) to suppress unwanted signals.

The filtered signals are applied to the 1st mixer circuit.

4-1-2 1ST MIXER AND 1ST IF CIRCUITS (MAIN-R UNIT)

The 1st mixer circuit converts the received signals into fixed frequency of the 1st IF signal with the 1st LO signal. By changing the 1st LO signal, only the desired frequency passes through the bandpass filter at the next stage of the 1st mixer circuit.

The RF signals from the bandpass filter (F2) are mixed with the 1st LO signal, where come from the 1st VCO circuit (Q471, Q472, D471), at the 1st mixer circuit (IC71) to produce a 243.95 MHz 1st IF signal. The 1st IF signal is passed through the bandpass filter (F171) to suppress unwanted signals and pass only the desired signals.

The filtered signal is applied to the 2nd IF circuit.

4-1-3 2ND MIXER AND 2ND IF CIRCUITS (MAIN-R UNIT)

The 2nd mixer circuit converts the 1st IF signal into the 2nd IF signal with the 2nd LO signal.

The filtered 1st IF signal from the bandpass filter (F171) is mixed with the 2nd LO signal (275.00 MHz), where come from the 2nd VCO circuit (Q631, D630), at the 2nd mixer circuit (Q131) to produce a 31.05 MHz 2nd IF signal. The 2nd IF signal is passed through the MCF (F1191). The filtered signal is applied to the IF amplifier (Q191) and then applied to the 3rd mixer circuit in the demodulator IC (IC191).

4-1-4 DEMODULATOR CIRCUIT (MAIN-R UNIT)

The demodulator IC (IC191) contains the 3rd mixer, limiter amplifier, quadrature detector, active filter and noise amplifier, etc.

The amplified 2nd IF signal from the IF amplifier (Q191) is applied to the 3rd mixer section of the demodulator IC (IC191, pin 16) and is then mixed with the 3rd LO signal to be converted into a 450 kHz 3rd IF signal. The 3rd IF signal from the 3rd mixer section (IC191, pin 3) passes through the ceramic filter (F1193) to remove unwanted heterodyned frequencies. The filtered signal is amplified at the limiter amplifier section (IC191, pin 5) and then applied to the quadrature detector section (IC191, pins 10, 11) to demodulate the digital audio or low speed data signals.

The 3rd LO signal (30.6 MHz) is produced at the 1st PLL circuit by doubling its reference frequency (X400: 15.3 MHz) at the doubler circuit (Q550).

• RF AND IF CIRCUITS

The digital audio or low speed data signals are output from pin 9 of the demodulator IC (IC191) and are amplified at IC343 (pins 6, 7).

The amplified signals are applied to the LOGIC-R unit via J1801 (pin 20).

4-1-5 DIGITAL CIRCUITS (LOGIC-R UNIT)

The digital circuits convert the demodulated digital audio or low speed data signals format for communication to ID-RP2C.

The demodulated digital audio or low speed data signals from the amplifier (MAIN-R unit; IC343, pin 7) are applied to the GMSK MODEM (IC150, pin 11) via J400 (pin 20). The applied signals are synchronized with the clock signal, then the synchronized signals are applied to the CPU (IC50) via the FPGA IC (IC200).

The output signals from the CPU (IC50) are amplified at the buffer amplifier (IC901) and then applied to the REAR unit via J901.

The amplified signals are applied to the connected repeater controller (ID-RP2C) via [CONT I/O] (REAR unit; J2).

4-2 TRANSMITTER CIRCUITS

4-2-1 DIGITAL CIRCUIT (LOGIC-T UNIT)

The digital circuits convert the digital audio or low speed data signals for transmit.

The digital audio or low speed data signals from the connected repeater controller (ID-RP2C) are amplified at the buffer amplifier (IC901) and then applied to the CPU (IC50) via [CONT I/O] (REAR unit; J2).

The applied digital audio or low speed data signals to the CPU (IC50) are processed and then applied to the FPGA IC (IC200) to split to the I and Q baseband signals for quadrature modulation. The I/Q baseband signals output from pins 75–80, 82–86 (IC200; for I signals), and 87–89, 92–99 (IC200; for Q signals) and then applied to the D/A converters (R250–R271 for I signals, R272–R293 for Q signals).

The converted I/Q baseband signals are passed through the baseband filters (IC300, IC302; for I signal), and (IC301, IC302; for Q signal) and then applied to the MAIN-T unit via J400 (pin 1 for I signal, pin 3 for Q signal).

4-2-3 MODULATION CIRCUIT (MAIN-T UNIT)

The modulation circuit modulates the 2nd LO signal at the quadrature modulation circuit (IC890) using the I/Q baseband signals from the LOGIC-T unit.

The I/Q baseband signals from the LOGIC-T unit are amplified at the I/Q baseband amplifiers (IC832, pins 1, 2 for I signal, pins 6, 7 for Q signal) via J400 (pin 1 for I signal, pin 3 for Q signal) and then applied to amplifier section of the quadrature modulator (IC890, pin 4 for I signal, pin 7 for Q signal). The 2nd LO signal is also applied to the $\pm 45^\circ$ phase splitter section of the quadrature modulator (IC890, pin 8) and then phase shifted and split 2nd LO signals are amplified at the LO amplifier sections. The amplified LO signals are modulated with the I/Q baseband signals at I/Q modulator sections and then combined at the combining amplifier section. The modulated signal is output from pin 14 (IC890) after amplified at the RF amplifier section.

The modulated signal is passed through the bandpass (FI880) and low-pass (L892, L893, C904–C907) filters and then applied to the 1st mixer circuit.

• DIGITAL CIRCUITS

4-2-4 1ST MIXER CIRCUIT (MAIN-T UNIT)

The filtered signal from the low-pass filter (L892, L893, C904–C907) is applied to the 1st mixer circuit (IC960, pins 1, 6). The applied signal is mixed with the 1st LO signal coming from the 1st VCO circuit (Q471, Q472, D471) via the buffer amplifiers (Q473, Q710) to convert into the RF signal. The RF signal from the 1st mixer circuit (IC960, pin 6) is passed through the bandpass filter (F1961) and then amplified at the RF amplifier (IC1021). The amplified signal is passed through the bandpass filter (F11020) to suppress spurious components.

The filtered signal is applied to the pre-drive circuit.

4-2-5 DRIVE/POWER AMPLIFIER CIRCUITS (MAIN-T UNIT)

The drive/power amplifier circuits amplify the RF signal to the to the output level.

The filtered RF signal from the bandpass filter (F11020) is amplified at the pre-drive (Q1080), drive (Q1081) and power (IC1160) amplifiers to obtain a stable 10 W of output power.

The power amplified signal from the power amplifier (IC1160, pin 4) is passed through the SWR detector circuit (D1166, D1170), low-pass filter which contains strip-line and C1198, and then applied to the transmit antenna connector (CASE; W5) via J1 (CHASSIS-T).

4-2-6 APC CIRCUIT (MAIN-T UNIT)

The APC circuit protects power amplifier from a mismatched output load and stabilizes the output power.

The SWR detector circuit (D1166, D1170) detects the forward signals and reflection signals, and converts it into DC voltage. The output voltage is at a minimum level when the antenna impedance is matched with 50 Ω and is increased when it is mismatched.

The detected voltage is applied to the APC amplifier (IC1250, pins 3, 4) and is compared with the reference voltage which is supplied from the CPU (LOGIC-T unit; IC50, pin 85) as "PCON" signal.

When antenna impedance is mismatched, the detected voltage exceeds the power setting voltage. The output voltage of the APC amplifiers (IC1250, IC1251) controls the bias voltage of the power amplifier (IC1160) to reduce the output power.

4-3 PLL CIRCUITS

4-3-1 PLL CIRCUITS (MAIN-R/MAIN-T UNITS)

The PLL circuit provides stable oscillation of the 1st LO frequencies and 2nd LO frequency. The PLL output compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by the divided ratio (N-data) of a programmable divider.

4-3-2 1ST PLL CIRCUITS (MAIN-R/MAIN-T UNITS)

The 1st PLL circuit oscillates the 1st LO frequencies, and the signals are applied to the 1st mixer circuit. The oscillated signals from the 1st VCO circuit (Q471, Q472, D471) are applied to the buffer amplifiers (Q473, Q474) and are then applied to the PLL IC (IC400, pin 6).

The PLL IC contains a prescaler, programmable counter, programmable divider and phase detector, etc.

The applied signal is divided at the prescaler and programmable counter section by the N-data ratio from the CPU (LOGIC-R/LOGIC-T units; IC50). The divided signal is detected on phase at the phase detector using the reference frequency (X400: 15.3 MHz) and output from pin 4 (IC400). The output signal is passed through the loop filter and is then applied to the 1st VCO circuit.

The oscillated signal at the 1st VCO is buffer amplified at Q473 and then passed through the bandpass filter (L474–L477, C488–C497).

The filtered signal is applied to the buffer amplifier (Q710) and then applied to the RX switch (MAIN-R unit; D711), and TX switch (MAIN-T unit; D710).

• APC CIRCUITS

RECEIVE SIGNAL (MAIN-R UNIT)

The receive 1st LO signal from the RX switch (D711) is applied to the 1st mixer circuit (IC71).

TRANSMIT SIGNAL (MAIN-T UNIT)

The transmit signal from the TX switch (D710) is applied to the 1st mixer circuit (IC960).

4-3-3 2ND PLL CIRCUIT (MAIN-R/MAIN-T UNITS)

The 2nd PLL circuit oscillates the 2nd LO frequency, and the signal is applied to the 2nd mixer circuit and quadrature modulator.

The signal oscillated at the 2nd VCO circuit (Q631, D630) is amplified at the buffer amplifiers (Q632, Q633) via low-pass filter (L631, C653, C654) and then applied to the PLL IC (IC550, pin 19). The applied signal is divided at the prescaler and programmable counter section by the N-data ratio from the CPU (LOGIC-R/LOGIC-T units; IC50). The divided signal is detected on phase at the phase detector using the reference frequency (X400: 15.3 MHz) and output from pin 13 (IC550).

The detected signal is passed through the loop filter (R555–R557, C564, C567) and then applied to the 2nd VCO circuit.

The oscillated signal at the 2nd VCO is amplified at the buffer amplifiers (Q632 Q771) and is then applied to the RX switch (MAIN-R unit; D771), and TX switch (MAIN-T unit; D770).

RECEIVE SIGNAL (MAIN-R UNIT)

The receive 2nd LO signal from the RX switch (D771) is applied to the 2nd mixer circuit (Q131).

TRANSMIT SIGNAL (MAIN-T UNIT)

The transmit signal from the TX switch (D770) is applied to the quadrature modulator (IC890).

4-4 POWER SUPPLY CIRCUITS

4-4-1 LOGIC-R/LOGIC-T UNITS VOLTAGE LINE

Line	Description
5V	Common 5 V controlled by the +5 V regulator circuit (IC500, Q500, Q501) using the "PWRS" signal from the CPU (IC50, pin 101). The output voltage is applied to the baseband filters (IC300–302), etc.
3.3V	Common 3.3 V converted from the 5V line by the 3.3V regulator circuit (IC502). The output voltage is applied to the FPGA IC (IC200) and buffer amplifier (IC901), etc.
3.3V	Common 3.3 V converted from the 5V line by the 3.3V regulator circuit (IC504). The output voltage is applied to the CPU (IC50) and A/D converter (IC55), etc.

• PLL CIRCUITS

4-4-2 MAIN-R/MAIN-T UNITS VOLTAGE LINE

Line	Description
HV	The voltage from a DC power supply.
VCC	The same voltage as the HV line which is controlled by the power switching circuit (Q23, Q24). When the power switch is pushed, the CPU outputs the "PWR" control signal to the power switching circuit to turn the circuit ON.
+9	Common 9 V converted from the HV line at the +9 regulator circuit (IC1330). The output voltage is applied to the 1st VCO (Q471), etc.
+5	Common 5 V converted from the +9V line at the 5 V regulator circuit (IC1331). The output voltage is applied to the APC amplifier (IC1251) and buffer amplifier (Q710), etc.
DM+5 (MAIN-T unit only)	Common 5 V converted from the +9V line at the 5 V regulator circuit (IC830). The output voltage is applied to the modulation amplifiers (IC831, IC832), etc.
T+9 (MAIN-T unit only)	Transmit 9 V controlled by the T+9 regulator circuit (Q1333, Q1334, D1331) using the "TXS" signal from the CPU (LOGIC-T unit; IC50, pin 94). The output voltage is applied to the APC amplifier (IC1250), etc.
T+5 (MAIN-T unit only)	Transmit 5 V controlled by the T+5 regulator circuit (Q1336, D1332, D1333) using the "TXS" signal from the CPU (LOGIC-T unit; IC50, pin 94). The output voltage is applied to the RF amplifier (IC1021), etc.
R+5 (MAIN-R unit only)	Receive 5 V controlled by the R+5 regulator circuit (Q1337) using the "RXS" signal from the CPU (LOGIC-R unit; IC50, pin 95). The output voltage is applied to the RF amplifier (Q2) and 1st mixer (IC71), etc.
T+3 (MAIN-T unit only)	Transmit 3 V controlled by the T+3 regulator circuit (Q1342) using the "TXS" signal from the CPU (LOGIC-T unit; IC50, pin 94). The output voltage is applied to the 1st mixer (IC960), etc.
R+3 (MAIN-R unit only)	Receive 3 V controlled by the R+3 regulator circuit (Q1343) using the "RXS" signal from the CPU (LOGIC-R unit; IC50, pin 95). The output voltage is applied to the RF amplifier (Q1), etc.

4-5 PORT ALLOCATIONS

4-5-1 CPU (LOGIC-R/LOGIC-T UNITS; IC50)

Pin number	Port name	Description
42	TXD1	Output data signals to the USB controllers (IC550, pin 24).
43	RXD1	Input port for data signals from the USB controllers (IC550, pin 25) via the (IC553).
53	SDA	I/O port for data signals from/to the EEPROMs (IC54, pin 5).
54	SCL	Outputs clock signal to the EEPROMs (IC54, pin 6).
71	RESET	Input port for reset signal form the reset ICs (IC52, pin 1).
72	P2RSC	Outputs control signal to the mode switches (MAIN-R/MAIN-T units; IC551, pin 5) via the level converter (IC55).
73	P2STC	Outputs strobe signal to the 2nd PLL ICs (MAIN-R/MAIN-T units; IC550, pin 3) via the level converter (IC55).
74	PDATC	Outputs the data signal to the 1st and 2nd PLL ICs (MAIN-R/MAIN-T units; IC400, pin 15, IC550, pin 5) via the level converter (IC55).
75	PSCKC	Outputs clock signal to the 1st and 2nd PLL ICs (MAIN-R/MAIN-T units; IC400, pin 14, IC550, pin 4) via the level converter (IC55).
76	P1STC	Outputs strobe signal to the 1st PLL ICs (MAIN-R/MAIN-T units; IC400, pin 16) via the level converter (IC55).
77	+5AC	Outputs control signal to the 5A and D+5 regulator circuits (MAIN-R/MAIN-T units; Q1345, Q1347) via the level converter (IC55). Low: While the +5 and D+5 regulators are activated.
85	PCON	Outputs control signal to the TX power controller (MAIN-T unit; Q1250).
86	ULCK	Input port for the PLL unlock signal. High: The PLL circuit is unlocked.
94	TXS	Outputs control signal to the T+5, T+3 regulator circuits (MAIN-T unit; Q1336, Q1342). High: During transmit.
95	RXS	Outputs control signal to the R+5, R+3 regulator circuits (MAIN-R unit; Q1337, Q1343). High: During receive.
103	AFCSW	Outputs control signal to AFC switch (IC352, pin 5).
105	DACK2	Outputs clock signal to the D/A converter (IC57, pin 7).
106	DADAT2	Outputs the data signal to the D/A converter (IC57, pin 6).
107	DACK1	Outputs clock signal to the D/A converter (IC56, pin 7).

Pin number	Port name	Description
108	DADAT1	Outputs the data signal to the D/A converter (IC56, pin 6).
128	FSTB	Outputs strobe signal to the FPGA IC (IC200).
129	MSTRC	Outputs strobe signal to the liner CODEC IC (IC1) and FPGA IC (IC200).
130	MDATC	Outputs the data signal to the liner CODEC IC (IC1) and FPGA IC (IC200).
131	MCLKC	Outputs clock signal to the liner CODEC IC (IC1) and FPGA IC (IC200).
132	MRESC	Outputs reset signal to the liner CODEC IC (IC1) and FPGA IC (IC200).
