VHF/UHF Desktop Repeater

## TKR-720(N)/820(N)

- **Synthesized design for rapid set-up and reliable performance**
- **Adjustable power output suitable for small- to medium-sized applications**
- **High performance receiver works equally well in urban, suburban and rural areas**
- **Field programmable Quiet Talk (QT) and Digital Quiet Talk (DQT) signaling systems**
- **Compact packaging for desktop operation**
- **Die-Cast Chassis and Large Heatsink provide a stable foundation for heavy duty-cycle use**
- **Modular design isolates receiver and transmitter sections for maximum reliability and shielding**

**Advanced synthesized RF design** means the TKR-720(N)/820(N) is easy to program and reconfigure as necessary, utilizing E<sup>2</sup>PROM technology, so you have both flexibility and reliability combined in a compact, attractive package. In addition, **the temperature compensated crystal oscillator (TCXO)** provides the utmost in frequency accuracy and stability.

The **adjustable RF power output** delivers just the right amount of coverage for your requirements. It can be configured with low power for small industrial plants on UHF [TKR-820(N)] or high power on VHF [TKR-720(N)] to cover an entire valley in the remote wilderness. Your technician can program the UHF power from 2 to 25 watts, and the VHF power from 15 to 50 watts.

The TKR-720(N)/820(N) desktop repeater provides a quality solution for any small to medium-sized RF communications system, whether it's busy downtown in 'intermod alley' or working a lumber yard in the suburbs. The rugged, compact design utilizing advanced synthesized RF technology lets you build a quality system that users can depend on around the clock.

The **high-performance receiver** has excellent sensitivity, selectivity, intermodulation and spurious/image rejection specifications so you can operate the unit equally well in both RF-congested urban areas and wide open rural settings.

The **Quiet Talk (QT) and Digital Quiet Talk (DQT)** signaling systems allow you to operate up to 8 tones, including cross tone or cross code. And because users only hear traffic relevant to their job, productivity and overall system effectiveness goes up.

The **compact desktop design** means that you do not have to create special rooms with environmental controls — the TKR-720(N)/820(N) is equally at home on a working desktop at the center of the action or in a dedicated communications equipment room.

The **die-cast chassis and large heatsink** keeps the circuitry well-protected from physical abuse and enables long operating hours. And if the AC power goes down, the optional **DC auto-revert** feature keeps your communications system up until technical help arrives.

Inside, the **modular design** carries the dependability factor even further, separating the receiver and transmitter circuits for optimal shielding and isolation.

## GENERAL

## INTRODUCTION

## SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service informations for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins of Manual Revisions. These are issued as required.

## ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

## PERSONNEL SAFETY

The following precautions are recommended for personnel safety :

- DO NOT transmit if someone is within two feet (0.6 meter) of the antenna.
- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- All equipment should be properly grounded before power-up for safe operation.
- This equipment should be serviced by a qualified technician only.
- Be careful against electric hazard, for the commercial power supply is being applied to the internal circuitry of the radio even when the Power switch is OFF.

## FCC COMPLIANCE AND TYPE NUMBERS

Type acceptance number	Frequency range	Compliance
ALHTKR-720-1	150 to 174MHz	Part 22, 74 and 90

## 1. POWER-UP

To push on the radio. The POWER indicator will illuminate to indicate power is ON.

## 2. TO RECEIVE

Operation	Procedure
1. Disable QT If so programmed.	Push on MONITOR switch.
2. Unsquench radio	Turn SQUELCH control counter-clockwise until noise is heard.
3. Set VOLUME control	Adjust VOLUME control for a normal listening level.
4. Set SQUELCH control	Advance SQUELCH control clockwise until noise just stops.
The radio will now receive all traffic on the selected channel.	
5. Enable QT If so programmed.	Press the MONITOR switch to OFF.
You will now hear messages for your system only.	

## 3. TO TRANSMIT (In case a microphone is connected)

Operation	Procedure
1. Disable QT	Depress MONITOR switch on front panel or microphone.
2. LISTEN	DO NOT TRANSMIT if channel is in use.
3. Key transmitter	Press and hold the microphone PTT switch. The Red LED on the front panel will glow indicating the transmitter is ON.
4. Transmit message	Hold microphone at about 2 inches distance and speak at a normal voice level. Keep transmissions brief.
5. Receive reply	Release the microphone PTT switch.
6. Enable QT at end of the conversation If so programmed.	Depress MONITOR to the out position.

## GENERAL

### 4. DURING OPERATION OF REPEATER

Operation	Procedure
1. Enable repeat	Press the REPEAT switch to ON.
2. Start of repeat	When a signal including the object tone signal (provided that it has been programmed) is input and if its level is higher than the preset squelch level, a signal modulated by the set tone signal (provided that it has been programmed) and received audio signal is transmitted.
3. End of repeat	When the received signal disappears, the transmission is stopped after the set period of time. There indicator lights while the signal is transmitted.
4. Disable repeat	Press the REPEAT switch again to OFF.

### PRE-INSTALLATION CONSIDERATIONS

#### 1. UNPACKING

Unpack the radio from its shipping container and check for accessory items. If any item is missing, please contact KENWOOD immediately.

#### 2. LICENSING REQUIREMENTS

Federal regulations require a station license for each radio installation (mobile or base) be obtained by the equipment owner. The licensee is responsible for ensuring transmitter power, frequency, and deviation are within the limits permitted by the station license.

Transmitter adjustments may be performed only by a licensed technician holding an FCC first, second or general class commercial radiotelephone operator's license. There is no license required to install or operate the radio.

#### 3. PRE-INSTALLATION CHECKOUT

##### 3-1. Introduction

Each radio is adjusted and tested before shipment. However, it is recommended that receiver and transmitter operation be checked for proper operation before installation.

##### 3-2. Testing

The radio should be tested complete with all cabling and accessories as they will be connected in the final installation. Transmitter frequency, deviation, and power output should be checked, as should receiver sensitivity, squelch operation, and audio output. QT equipment operation should be verified.

### 4. PLANNING THE INSTALLATION

#### 4-1. General

Inspect the vehicle and determine how and where the radio antenna and accessories will be mounted.

Plan cable runs for protection against pinching or crushing wiring, and radio installation to prevent overheating.

#### 4-2. Antenna

When an outdoor antenna is to be installed, select an unobstructed position with good visibility.

The VSWR of the antenna should be no more than 2.

Select a coaxial cable with as small loss as possible, and its length should be as short as possible.

#### 4-3. Radio

Install the radio on a rack using rack-mount brackets, or on a flat surface that can withstand its weight. Do not install the radio in a place subject to direct sunlight or near heating equipment. Avoid wet place, and install it in a well-ventilated place.

#### 4-4. AC power supply

This unit has been designed for use exclusively with commercial AC power supply. As the rated current for transmission output attains about 2A, connect the unit to a wall outlet that can handle this current with margin.

### SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained in this manual.

## SYSTEM SET-UP

**Preparation :** Prepare an EEPROM writer, KPT-20 or KPT-50.

## INSTALLATION

### Installing the EEPROM of Signaling Unit

**Note :** EEPROM is inserted into the Signaling unit of the TKR-720. Install it after writing the data using the ROM writer (KPT-20 or KPT-50).

1. Remove the 10 screws ( ❶ ) holding the upper case to remove the upper case.

2. Remove the 11 screws ( ❷ ) retaining the shield cover to remove the shield cover.
3. Insert the EEPROM ( ❸ ) on which the data has been written into the IC socket (IC10) on the Signaling unit.

## INSTALLATION

### Installing the Duplexer

**Note :** When installing the duplexer in the TKR-720, use the either of the following products ;

1. CELWAVE (USA), 144 to 174MHz (PD636-6A)
2. Installation kit (KCT-11) : option

Installing fitting : J21-4339-03 .....	1pc
M-M conversion receptacle : E04-0183-05 .....	1pc
Lead with connector : E37-0120-08 .....	3pc
Truss screw (M4 x 2) : N09-0704-05 .....	6pc
Tapping screw (M3 x 8) : N87-3008-46 .....	2pc

1. Remove the 10 screws ( ❶ ) holding the upper case to remove the upper case.
2. Remove the 4 screws ( ❷ ) holding the lower case to remove the lower case.
3. After removing the upper and lower cases, turn the set upside down, as shown in the figure ( ❸ ).
4. Remove the coaxial cables ( ❹ ) connected to the RX antenna connector.
5. Remove the bushing ( ❺ ) in the hole in the rear panel, insert the M-type receptacle ( ❻ ) into the hole (longer side facing in), and secure it with two tap-tight screws ( ❼ ).
6. Release the coaxial cable ( ❹ ) from the wire bands ( ❽ and ❾ ) and secure it with the wire bands ( ❿ and ⓫ ) on the opposite side.

# INSTALLATION

7. Secure the installation fitting (12) supplied with the KCT-11 to the duplexer (13) with two screws (14), and put it in position in the TKR-720 without securing it.
8. Connect the coaxial cable (4) to the RX connector of the duplexer. Connect the coaxial cables supplied with the KCT-11 to the TX ANT-(15) and duplexer TX connector (16) via the M-type receptacle (17). Connect another cable to the duplexer ANT connector (18) and TKR-720 duplexer antenna connector (19).
9. After connecting the coaxial cables, secure the duplexer (13) to the TKR-720 with four screws (20).

**Note :** The input/output connectors of the duplexer manufacture by CELWAVE are located as shown in the figure. Pay attention when connecting the connectors.

**Note :** When making adjustments after installing the duplexer, remove the front panel and hold down the sub-panel (21), then perform adjustments from the adjusting holes (22).

## INSTALLATION / CONVERSION

### Attaching the Rack-mount Brackets

#### (for EIA racks)

The brackets and screws are optional.

Brackets : J21-4250-04 (Common for left and right)

Screw : N09-0704-05 (Use 2 screws per bracket)

1. Attach the 2 brackets ( ❶ ) using 4 screws ( ❷ ).

2. When the TKR-720 is to be mounted vertically :  
Attach 4 brackets ( ❸ ), using 8 screws ( ❹ ), to be side of the bottom panel.

## CONVERSION

### Signaling Wait Mode Setting Method

#### • What is the signaling wait mode?

The KPT-20 or KPT-50 can write signaling codes into channels 1 to 16. The codes written in up to eight channels can be used at a time, and the codes written in channels 1 to 8 are effective. One or more signaling codes to be waited for in the repeater mode can be selected. They can be changed by W4 of the Signaling unit (X52-3140-10).

#### • Wait mode setting method

Ref. No.	Function	Mode	Setting
W4	Decode change in repeater mode	Short	Two or more codes
		Open	One code

Factory setting : Short

W4 part No. : E31-1448-05

If the signaling wait is one code (W4 : open), the TKR-720/N uses the code written in channel 1, and the TKR-720A uses the signaling code in the displayed channel. If several codes are waited for (W4 : short), the multiple signaling codes written in channels 1 to 8 can be waited for.

**Note :** This function is available in serial No. 504XXXXX or later, and IC8 (27C256QJESB) or later.

### SIGNALING UNIT (X52-3140-10)

# CONVERSION

## Modification of the DC Switching Circuit (For Backup during a Power Failure)

### : Excluding TKR-720A (M, M2)

The following parts (optional) are required for the circuit modification.

- Diode (S25VB10) ..... 1 pc.
- DC cable (E30-2076-15) ..... 1 pc.
- Connector with lead wires (E31-3389-15) ... 1 pc.
- Connector with lead wires (E31-3455-15) ... 1 pc.
- Screw (N87-4014-46) ..... 1 pc.

1. From the cover (1) attached to the rear panel, remove the 2 screws (2) and take off the cover.

2. Insert the connector with lead wires (3) into the hole on the rear panel (4) (so that the red lead is on the right).
3. Place the diode (5) so that its notch faces the direction shown in the illustration, and attach it using a screw (6).
4. Disconnect the connector (7) from the OUT terminal of the AVR unit, and connect its lead wire to pin 1 of the diode (5).

## CONVERSION

5. Connect the optional connector with lead wires ( **8** ) to the OUT terminal of the AVR unit and to pin 3 of the diode.
6. Connect the red lead ( **9** ) of the optional connector with lead wires to pin 2 of the diode, and its black lead ( **10** ) to the negative (-) terminal of chemical capacitor C101. Do not disconnect the lead wire which has been connected to the C101 negative terminal, but connect the black lead to it.

7. Connect the optional DC cable to the connector on the rear panel ( **11** ).

## DISASSEMBLY FOR REPAIR

### How to Remove the Case

1. Remove the 10 screws (1) holding the upper case to remove the upper case.
2. Remove the 4 screws (2) holding the lower case to remove the lower case.

### Disassembling the Transmitter/Receiver Section

#### 1. How to remove the transmitter/receiver section

1. Remove the 4 connectors (CN1 to CN4) connected to the panel (Display unit) (1).
2. Remove the 3 screws (2) holding the transmitter/receiver section.
3. While lifting up on the transmitter/receiver section (3), remove the power supply connector (4) and the connector cable (5) connected to the frame, remove the screw (7) securing the transmitter/receiver section, and put the transmitter/receiver section back in place.
4. Remove the 4 screws (8) holding the transmitter/receiver section to the frame to remove the transmitter/receiver section.

## DISASSEMBLY FOR REPAIR

**2. How to remove the TX-RX unit**

1. Remove the 6 screws (1) retaining the shield cover to remove the shield cover.
2. Remove the 2 connectors (2) of the Signaling unit and the 6 screws (3) retaining the shield cover to remove the shield cover.
3. Remove the 6 screws (4) retaining the connectors CN2 to CN4.
4. Remove the 11 screws (5) attached on the bottom of the TX-RX unit to remove the shield cover.
5. Remove the 3 connectors CN1 (6), CN8 (7) and CN10 (8) connected to the TX-RX unit.
6. Remove the 4 screws (9) connected between the TX-RX unit and Final unit.
7. Remove the leaf spring fixing the two IC's to the frame with a screwdriver, etc. (10).
8. Remove the 11 screws (11) mounting the TX-RX unit to remove the TX-RX unit.

## DISASSEMBLY FOR REPAIR

### 3. Disassembling the Final unit ass'y

#### • Final unit (X45-3320-XX) side

1. Remove the soldered part (1) of the VHF connector and that (2) of the lead wire (coaxial cable installed through) from the final unit.
2. Remove the two screws (3) fixing the lead wires of the power connector.
3. Remove the screw (4) securing the cable holder.
4. Remove the two screws (5) fixing the transistor from the heat sink.
5. Remove the 14 screws (6) fixing the final unit from the heat sink to remove the final unit.
6. Remove the two screws (7) fixing the VHF connector to remove the connector from the heat sink.

Final unit

### 4. Drive unit (X45-3310-XX) side

1. Remove the 4 screws (1) retaining the shield cover to remove the shield cover.
2. Remove the soldered part (2) of the lead wire (coaxial cable installed through) from the drive unit.
3. Remove the two screws (3) fixing the module unit from the heat sink.
4. Remove the screw (4) fixing the transistor from the heat sink.
5. Remove the 8 screws (5) fixing the drive unit from the heat sink to remove the drive unit.

**Note** :When replacing only the module, remove the screws (3) and then remove the four soldered parts of the module terminals (6) to remove the module.

## DISASSEMBLY FOR REPAIR

## How to Remove the Panel

1. Pull off the VOLUME, SQUELCH and CHANNEL knobs (1). CHANNEL knob is TKR-720A only.
2. Release the 6 hooks (2) located on the upper and lower section, and holding the sub-panel by pushing them up with your finger. Then remove the sub-panel (3) by pulling it out toward the front.

\* : TKR-720A only

## Disassembling the Sub-panel

1. TKR-720/N  
Remove the 2 nuts and 2 washers holding the VOLUME and SQUELCH VRs (1).  
TKR-720A  
Remove the 3 nuts and 3 washers holding the VOLUME, SQUELCH and CHANNEL VRs (1).  
Then remove the 2 screws (2) holding the POWER switch.
2. Remove 2 of the screws (3) holding the sub-panel, and loosen the other 2 screws (4), then tilt the sub-panel toward the front (5).
3. Remove the 5 connectors (6) connected to the Display unit, and remove the connector (7) connected to the POWER switch.
4. Remove the 2 remaining screws (8) holding the sub-panel to remove the sub-panel.

\* : TKR-720A only

5. Remove the 9 screws (9) holding Display unit (A/4) and (B/4) to the sub-panel, and remove the Display unit (A/4) and (B/4).
6. Remove the 4 screws (10) holding the speaker to the sub-panel to remove the speaker.

## DISASSEMBLY FOR REPAIR

### Disassembling the AVR Unit

#### 1. How to remove the AVR unit (X43-3040-10) (A/2)

1. Remove the 8 connectors (1) connected to the AVR unit.
2. Remove the 4 screws (2) holding the AVR unit to the rear panel, and remove the AVR unit from the rear panel.

#### 2. Disassembling the AVR unit (X43-3040-10) (A/2)

1. Remove the 4 screws (3) holding the AVR unit.
2. Desolder the 4 wires (4) connected to the bases and emitters of transistors Q5 and Q6.
3. Remove the 2 screws (5) on the radiation cover attached to the heat sink to remove the radiation cover.
4. Remove the 4 screws (6) of the transistors (Q5 and Q6) attached to the heat sink, and remove the AVR unit (A/2).

**DISASSEMBLY FOR REPAIR****3. How to remove the AVR unit (X43-3040-10) (B/2) and the electrolytic capacitor (C101)**

1. Remove the 4 wires (7) connected to the AVR unit.
2. Remove the 4 screws (8) holding the AVR unit to remove the AVR unit.
3. Remove the 3 screws (9) holding the electrolytic capacitor (C101).

**4. How to remove the power transformer**

1. Remove the 4 screws (10) holding the power transformer to the bottom plate, and remove the power transformer.

## CIRCUIT DESCRIPTION

## Transmitter Circuit

The signal generated at the Transmitter Voltage Controlled Oscillator (TX VCO, Z5), which operates at the transmit frequency, is fed to a voltage amplifier Q101 (2SC2954) after going through a 3dB attenuator. The signal is further amplified by Q102 (2SC2538-22-A) and again fed through a 3dB attenuator before being applied to the driver module (IC101, M57719 or M57719L-24).

At IC101, the signal is power amplified and the output of IC101 is applied to the final power amplifier (Q2, 2SC2694). After power amplification at Q2, the signal is routed to the antenna connector after going through the antenna switching circuit and a 7-pole lowpass filter.

Q101 is biased for class B operation, which renders a low threshold, insuring a smooth operation from a very small signal level.

Q102 input circuit impedance is closely matched to the Q101 output impedance with low Q design in mind to obtain stable, board band operation. Incorporation of a low Q micro-strip line design permits transmitter operation without returning within its entire operating range.

Transmitter forward power is monitored at the Automatic Power Control (APC) detector (D3, 1SS101), located between the antenna switch and the lowpass filter, and this detector output is used for a comparison against the reference voltage at a differential amplifier (Q3 and Q4, 2SC3326A) after the level is set at VR1. The differential amplifier output drives the APC DC amplifier (Q103, 2SB951AQ), which in turn controls supply voltages to Q102 and IC101, to maintain constant output power.

To protect the transmitter power amplifier stages, there is a reflected power protection circuit.

The reflected power protection reduces the transmitter output power by controlling the differential amplifier, if a high VSWR condition is detected at the reflected power detector (D2, 1SS101).

## CIRCUIT DESCRIPTION

## Receiver Circuit

The surge voltage from the antenna is removed or absorbed by L27 and D12 (1SS226), and the receive signal is passed through the bandpass filter (L20, L21).

The signal is then amplified by an RF amplifier (Q14, 2SK125 and Q15, 2SK125 connected in parallel) and filtered again by bandpass filters (L24, L25 and L26). After amplification and filtering, the signal is applied to a double balanced modulator (DBM, D4, ND487C1T) for mixing with the first local signal generated at the common frequency synthesizer.

The heterodyning action of the first mixer produces a 21.4MHz first intermediate frequency (1st IF), which is applied to a 6-pole monolithic crystal filter (MCF, XF1) after being amplified by a buffer amplifier (Q4, 2SK125 and Q5, 2SK125 connected in parallel). The signal out of the MCF is further amplified by a 1st IF amplifier (Q6, 2SK302GR) and sent to the IF unit (Z8).

The signal applied to Z8 is mixed with a 20.945MHz signal at IC1 in Z8, which produces a 455kHz 2nd IF signal. The signal obtained at the 2nd mixer is filtered by a 455kHz ceramic filter (CF1) and amplified by limiting amplifier stages in IC1. The recovered audio signal from the incoming signal is also obtained at IC1 by a quadrature type FM detector. This recovered audio signal is then sent to the audio amplifier circuit and to the noise actuated squelch circuit.

In the receiver audio amplifier section, the recovered audio signal from Z8 is first applied to a bandpass filter/voltage controlled amplifier (BPF/VCA, Z9) unit. At this BPF/VCA unit, the signal is amplified and sent to pin 9 of CN6 as the DET signal. The signal is returned to Z9 by way of the Signaling unit. IC1 (NJM4558M) forms a lowpass filter and a highpass filter, and IC2 forms a bandpass filter and lowpass filter in Z9. The frequency components below 300Hz and above 3000Hz are attenuated in the above filter circuits.

The filtered audio signal is then applied to an electronic volume control (IC3, M5222FP), where the audio signal level is controlled by a DC voltage sent from the front panel volume control. The signal is then de-emphasized and sent to the audio power amplifier circuit (IC1,  $\mu$ PC1242H) after going through squelch switches (Q9 and Q10, 2SC3326A).

The alert signal is also applied to IC1, when a specific signaling board, which requires an audible alert through the speaker, is installed. The signal, which is amplified by IC1, drives either the internal speaker or the optional external speaker and this selection is done through the accessory connector located on the Final unit.

Fig. 2 Receiver block diagram

## CIRCUIT DESCRIPTION

## Squelch Circuit

The high frequency component of the recovered audio signal is fed to a noise amplifier within IC1 (MC3361BD) of Z8 and it is further amplified by an external noise amplifier (Q1, 2SC2712Y). The signal is then detected by a noise detector (D1, DA204K) and applied to the squelch switch in IC1. This detected noise is also routed to the squelch control (VR1) through the Display unit (C/4) for adjusting the noise squelch sensitivity.

The busy information is sent from the above IC1 (75104G-604-1B) in the Display unit in serial format to turn on or off the busy LED. The squelch switch output and the Audio Control (AC) signal from the signaling board are combined at D8 (1SS184) and applied to

squelch switch transistors Q9 (2SC3326A) and Q10 (2SC 3326A) along with the inverted signal of transmit/receive control signal. The squelch switch controls the input signal to the audio amplifier to mute or unmute the receive audio.

While the busy LED is being controlled only by the noise squelch circuit, the actual audio signal is controlled by the following signals and in order to unmute the audio, each signal must be in the condition as specified.

SQL signal = Low

R8 line = High

T/R signal = High

## CIRCUIT DESCRIPTION

### RX Frequency Synthesizer

The RX frequency synthesizer consists of three major circuits. They are the temperature compensated crystal oscillator (TCXO, Z3), RX voltage controlled oscillator (RX VCO, Z2) and RX phase locked loop unit (RX PLL, Z1).

The TCXO is operating at 12.8MHz and its frequency stability is maintained within  $\pm 2.5$ ppm from  $-30^{\circ}\text{C}$  to  $+60^{\circ}\text{C}$ . This output signal is fed to the frequency synthesizer IC (IC2, JLC1075F) in Z1. At IC2, this signal is divided by 2560 to become a 5kHz reference signal.

The output from the RX VCO operates at the frequency of the receiver first local signal and a portion of the signal is fed to a dual modulus counter formed by IC1 (MB504F) and IC2 in Z1. IC1 divides the incoming signal by 1/64 or 1/65 depending on the control line status sent from IC2. The output of the dual modulus counter is also a 12.5kHz and this signal is compared against the 12.5kHz reference signal in a phase comparator at IC2. The output signal from the phase comparator is then fed back to the RX VCO after going through a charge pump and a lowpass filter to maintain the RX VCO frequency.

If this RX frequency synthesizer phase locked loop becomes UNLOCK, the unlock condition is detected by IC2 and it prevents the transmitter frequency synthesizer from sending a transmitter signal to following amplifier stages in order to prevent an unauthorized transmission.

### TX Frequency Synthesizer

The TX frequency synthesizer consists of three major circuits. They are the modulator/voltage controlled crystal oscillator (VCXO, Z6), TX voltage controlled oscillator (TX VCO, Z5) and TX phase locked loop unit (TX PLL, Z4).

The audio signal from the microphone amplifier and the Signaling unit is applied to the TX VCO (Z5) and the VCXO (Z6) operating at 12.8MHz to obtain an FM modulated signal. And its frequency stability is maintained within  $\pm 2.5$ ppm from  $-30^{\circ}\text{C}$  to  $+60^{\circ}\text{C}$ . This output signal is fed to the frequency synthesizer IC (IC2, JLC1075F) in Z4. At IC2, this signal is divided by 2560 to become a 5kHz reference signal.

The output from the TX VCO operates at the frequency of the transmit signal and a portion of the signal is fed to a dual modulus counter formed by IC1 and IC2 in Z4. IC1 divides the incoming signal by 1/64 and 1/65 depending on the control line status sent from IC2. The output of the dual modulus counter is also a 12.5kHz and this signal is compared against the 12.5kHz reference signal in a phase comparator at IC2. The output signal from the phase comparator is then fed back to the TX VCO after going through a charge pump and a lowpass filter to maintain the TX VCO frequency.

If this TX frequency synthesizer phase locked loop becomes UNLOCK, the unlock condition is detected by IC2 and it prevents the transmitter frequency synthesizer from sending a transmitter.

### Microphone Amplifier

The audio signal originating at the microphone is applied to a microphone amplifier unit (Z7) after going through a microphone sensitivity control (VR1).

The signal is amplified and voltage limited by IC1 and IC2 in Z7, then applied to an active lowpass filter/pre-emphasis network (IC3).

The processed audio signal is sent to the modulator/voltage controlled crystal oscillator (VCXO, Z6) and voltage controlled oscillator (TX VCO, Z5) in the transmitter frequency synthesizer via IC3.

### Reset Circuit

Upon initial power up, the line voltage gradually increases and this causes the reset system (IC3) to generate a reset pulse. This reset pulse is applied to the microprocessor (IC1) to insure the initialization of the circuit.

Fig. 5 Reset circuit block diagram

## CIRCUIT DESCRIPTION

### EEPROM Programming

Programming of data into the EEPROM (IC2) in the Display unit is done by connecting the KPT-20 or KPT-50 programmer to the transceiver by cable provided with the KPT-20 or KPT-50. When the programmer is connected to CN1 in the Display unit, this causes microprocessor IC1 to go into reset condition. In the reset condition, the output ports of IC1 becomes high impedance and are isolated from the data transfer lines. This permits data transfers between the programmer and the EEPROM.

### Signaling Unit

#### • Decoder operation

The receive audio signal from the receiver section is fed to the Signaling unit. A part of this signal is returned to the receive audio amplifier circuit and fed to mute circuit after going through an active high-pass filter, in which any frequencies below 300Hz are removed. The mute circuit control a transfer audio signal by microprocessor. The other part of the audio signal is fed through a fifth-order active low-pass filter, of which the cut-off frequency is set at 220Hz, to discriminate the QT and DQT signals from other audio signals.

The QT tone obtained from the above filtered audio signal is applied to the microprocessor (IC11) as an analog signal for tone detection after being amplified by IC4 (2/2).

The DQT code is passed through a low-pass filter IC3 (2/2), of which the cut-off frequency is 140Hz, and the circuit consists of IC3 (1/2) and IC5 (1/2), where the DC drift component (low frequency) is removed from the signal. The signal is then amplified by IC5 (2/2). The amplified signal is applied to IC1 after waveform shaping by Q2.

IC11 sends an audio control signal (AC) to the AC terminal of CN1 through an inverter (Q4) according to the status of the incoming signal. If the incoming QT tone or DQT code matches the data stored, the AC terminal of CN1 is forced to become "LOW" to unmute the receive audio circuit.

#### • Monitor circuit

The RESET terminal of CN1 is connected to the MONITOR and MIC MONITOR circuits in the repeater.

The RESET terminal signal level goes to "HIGH" state, if either the MONITOR switch is on or the microphones MONITOR switch is on, causing pin 4 (RESET) of IC11 to become "HIGH". In this condition, the AC terminal of CN1 is held "LOW", enabling only the noise actuated squelch operation.

#### • Encoder operation

In the transmit mode, the PTT terminal of CN1 becomes "LOW" and this information is inverted to "HIGH" by Q7 before being applied to IC11. Upon receipt of this PTT signal or when the programmed tone has been decoded at the time of the REPEAT operation, IC11 starts the encode function. The encode signal is sent out from output ports, A/D 0 through A/D 7, of IC11 in a binary format and is fed to a ladder network resistor (CP1) for Digital-to-Analog signal conversion. The output signal from CP1, which is either the QT tone or the DQT code, is routed to the TONE terminal of CN1 after going through a level control for modulating the transmit signal.

#### • Local/Repeater operation

When the REPEAT switch on the front panel of the main body is set to ON, the repeater operation is engaged, while when this switch is set to OFF, the full-duplex transceiver operation is engaged.

#### • Preset squelch operation

The squelch circuit for the repeater operation which is independent from the main body consists of noise conditioner IC6 (1/2), waveform shaper Q1, microprocessor IC11 and squelch sensitivity adjuster VR1.

The preset squelch level, the hangup timer time and the time-out timer time are compared in IC11 respectively with the voltages at pins 30, 29 and 28 set by VR1, VR2 and VR3 with the reference of the voltage at pin 31 of IC11 and are thus subject to software control.

**TAKEOVER Switch**

The TAKEOVER switch is used to isolate the remote control. (The remote control is isolated when the TAKEOVER switch is pressed.)

The following table shows the functions and specifications of the accessory connector terminals, together with the control terminals that are subject to the TAKEOVER control.

• **Accessory connector (J101)**

No.	Name	Functions & Specifications	Terminal subject to TAKEOVER control
1	HK	External hook terminal / Set this terminal to GND level before using external PTT. Unlike MIC HOOK, no monitor function is provided. (TKR-720/N only)	○
2	LG	Line input GND / Used for No. 5 (LI).	
3	DI	Direct modulation input terminal / External input terminal for QT and DQT : $\pm 750\text{Hz DEV}$ at approx. $600\Omega$ input impedance, $0.2\text{Vp-p}$ . Degree of modulation is to be adjusted externally.	
4	DO	Direct detection output / Direct output of detected (unfiltered) signal : Output impedance $10\text{k}\Omega$ . Output level : $-10\text{dBs}$ at $\pm 3\text{kHz DEV}$ , $1\text{kHz}$ .	
5	LI	Line input / Input terminal for external modulation. Standard modulation is provided at $600\Omega$ , $0.24\text{dBm}$ . Same as MIKE level except for input level.	○
6	SG	Speaker output GND / GND for output to external speaker. Used for No. 12 (SO).	
7	SB	+13.6V external power output / Power supply for external equipment. Up to 1A.	
8	PT	External PTT input / Transmission is started at GND level if No. 1 (HK) is at GND level.	○
9	SI	Internal speaker input / Usually connected to No. 12 (SO) via jumper wire.	
10	LO	Line output / Used for output of received signal, for standard modulation at $600\Omega$ , $-10\text{dBm}$ , $-6\text{dB/oct}$ , $300\text{Hz}$ to $3\text{kHz}$ . Interlocked with No.13 (CO).	○
11	GN	DC GND / GND for DC power supply.	
12	SO	Speaker output / Output terminal for external speaker.	
13	CO	Internal preset squelch output / Provides an output interlocked with internal preset squelch, or a tone squelch output when writing tone. When receiving signal, this output is at low level (open collector) with $10\text{mA}$ sink current.	
14	NC	Unused.	
15	NC	Unused.	

## CIRCUIT DESCRIPTION

### AVR Circuit

This power supply uses a tapped secondary transformer to maintain low voltage between the pass transistor collectors and emitters (Q5 and Q6) for excellent efficiency. Control and operating voltages are rectified and supplied independently for good ripple characteristics.

Temperature compensation for the regulator Zener diode D5 and error amplifier transistor Q4 is provided by silicon diodes D4 and D6.

At initial POWER-ON Q3 is ON to turn-down Q4 base voltage. This prevents a surge voltage from being output when no load is connected. As C5 charges, Q2 turns ON to shut Q3 OFF. Q4 is thereafter fully ON.

If the load is shorted, comparator Q1 is turned OFF and current proportional only to that in the initial turn-on circuit is output. When the output is shorted, the output current drops to 1A. This circuit protects the pass transistors, transformer and full wave bridge rectifies from thermal damage.

Changing between AC and DC is done with the DC switch (D101) for the TKR-720A only. The output from the AVR unit and the DC input from the external power input terminals are changed automatically.

## DESCRIPTION OF COMPONENTS

## AVR UNIT (X43-3040-10)

Ref. No.	Parts No.	Descriptions
Q1-Q3	2SC2712(Y)	DC amplifier
Q4	2SB968(Q)	DC amplifier
Q5, Q6	2N5885	DC amplifier
D1	1B2C1	Rectifier
D3	S25VB10	Rectifier
D4	1SS181	Temperature compensate
D5	RD7.5E(B2)	Voltage reference
D6	1SS181	Temperature compensate

## DRIVE UNIT (X45-3310-XX)

Ref. No.	Parts No.	Descriptions
Q101	2SC2954	RF amplifier
Q102	2SC2538-22-A	RF amplifier
Q103	2SB951A(Q)	DC amplifier
D101, 102	1SS181	Voltage reference

## FINAL UNIT (X45-3320-XX)

Ref. No.	Parts No.	Descriptions
Q2	2SC2694	RF power amplifier
Q3, 4	2SC3326(A)	DC amplifier
D1	SG-5L(R)	Reverse polarity protection
D2, 3	1SS101	RF detector
D4	1SS181	Current steering
D5	1SS181	Voltage reference

2SC2782 (TOSHI-BA)

## FINAL UNIT ASS'Y (X60-3230-XX)

Ref. No.	Parts No.	Descriptions
IC101	M57719 M57719L-24	RF amplifier (TX driver)

## SIGNALING UNIT (X52-3140-10)

Ref. No.	Parts No.	Descriptions
IC1	MC78L05M	Voltage regulator 5V
IC2	M51943BML	Reset system
IC3	XRA4558F	Data recovery, active filter
IC4	XRA4558F	Active filter
IC5	XRA4558F	Data recovery
IC6, 7	XRA4558F	Active filter
IC8	27C256QJESB	EPROM
IC9	TC74HC573AF	Data latch
IC10	XLJ93LC46	EEPROM
IC11	μPD78310AGF	Microprocessor
Q1	DTC144EK	Level translator
Q2	DTC144EK	Inverter
Q3-7	DTC144EK	DC switch
Q8	DTA114EK	DC switch
Q9	2SC3326(A)	Audio amplifier
Q10	2SJ106(GR)	Audio amplifier
D1, 2	1SS184	Current steering
D3	HSM88AS	Voltage clamp
D4-6	1SS184	Current steering
D7	B30-0838-05	LED (Red)
D8	MTZ8.2JB	Voltage reference

## DISPLAY UNIT (X54-3070-XX)

Ref. No.	Parts No.	Descriptions
IC1	75104G-604-1B	Microprocessor
IC2	XLJ93LC46	EEPROM
IC3	M51943BML	Precision reference
IC4	AN78N05	Voltage regulator 5V
IC5	μPC4558C	Audio amplifier
IC6	μPC4558C	Active filter
Q1, 2	DTC114EK	DC switch
Q3	2SA1162(Y)	Digital switch
Q6	2SC3326(A)	AF switch
Q7, 8	DTC114EK	DC switch
D1	B30-0855-05	LED (Red)
D2	B30-0856-05	LED (Green)
D3	B30-0855-05	LED (Red)
D4-6	1SS184	Voltage clamp
D7, 8	1SS181	Current steering
D10, 11	1SS181	Current steering
D13	1SS181	Current steering
D16	B30-0857-05	LED (Yellow)
D17	B30-0856-05	LED (Green)
D18	B30-0857-05	LED (Yellow)
D19, 21	1SS272	Current steering
D22, 23	B38-0308-05	LED display assy
D24	1SS133	Current steering

## DESCRIPTION OF COMPONENTS

## TX-RX UNIT (X57-3760-XX)

Ref. No.	Parts No.	Descriptions
IC1	$\mu$ PC1242H	AF power amplifier
IC2	MB3756	Voltage regulator
IC3	NJM4558D	AF amplifier
IC4	L78N08	Voltage regulator
Q1, 2	2SC2712(Y)	Voltage shift
Q4, 5	2SK125	IF amplifier
Q6	2SK302(GR)	IF amplifier
Q7	2SC2712(Y)	level translator
Q8	DTC114EK	Inverter
Q9, 10	2SC3326(A)	Audio mute switch
Q11	DTC114EK	DC switch
Q12, 13	DTC114EK	Inverter
Q14, 15	2SK125	FiF amplifier
D1, 2	1SV172	TX VCO output mute
D4	ND487C1T	Double balanced modulator
D5-11	1SS184	Current steering
D12	1SS226	Voltage clamp

## RX PLL : Z1, TX PLL : Z4 (X58-3140-XX)

Ref. No.	Parts No.	Descriptions
IC1	MB504F	Prescaler
IC2	JLC1075F	PLL system(or JLC1075DW)
Q1	2SC2714(Y)	RF amplifier
Q2-5	DTC114EK	Inverter
D1	RD3.0M(B2)	Level shifter

## RX VCO : Z2 (X58-3290-XX)

Ref. No.	Parts No.	Descriptions
Q1	2SK125	Oscillator
Q2	2SC2714(Y)	Buffer amplifier
Q3, 4	2SC3356	Buffer amplifier
D1	1SV166	Tuning

## TX VCO : Z5 (X58-3790-XX)

Ref. No.	Parts No.	Descriptions
Q1	2SK125	Oscillator
Q2	2SC2714(Y)	Buffer amplifier
Q3, 4	2SC3356	RF amplifier
D1	1SV166	Tuning
D2	1SV164	Modulator

## MIC AMP : Z7 (X59-3210-10)

Ref. No.	Parts No.	Descriptions
IC1	NJM4560M	Mic amplifier/Limiter
IC2	NJM4558M	Limiter
IC3	NJM4558M	Active filter
Q1	2SC3326(A)	Muting switch

## IF : Z8 (X59-3220-10)

Ref. No.	Parts No.	Descriptions
IC1	MC3361BD	IF system
Q1	2SC2712(Y)	Noise amplifier
D1	DA204K	Noise detector

## BPF/VCA : Z9 (X59-3230-10)

Ref. No.	Parts No.	Descriptions
IC1	NJM4558M	Audio amplifier
IC2	NJM4558M	Active filter
IC3	M5222FP	Electronic attenuator
IC4	NJM4558M	Active filter

## PACKING

# ADJUSTMENT

## Test Equipment Required for Alignment

Test Equipment	Major Specifications	
1. Standard Signal Generator (SSG)	Frequency Range Modulation Output	136 to 174MHz Frequency modulation and external modulation 0.1μV to greater than 1mV
2. Power meter	Input Impedance Operation Frequency Measurement Capability	50Ω 136 to 174MHz or more Vicinity of 50W
3. Deviation meter	Frequency Range	136 to 174MHz
4. Digital Volt Meter (DVM)	Measuring Range Accuracy	1 to 10V DC High input impedance for minimum circuit loading
5. Oscilloscope		DC through 30MHz
6. High Sensitivity Frequency Counter	Frequency Range Frequency Stability	10Hz to 600MHz 0.2ppm or less
7. Ammeter		15A
8. AF Volt Meter (AF VTVM)	Frequency Range Voltage Range	50Hz to 10kHz 3mV to 3V
9. Audio Generator (AG)	Frequency Range Output	50Hz to 5kHz or more 0 to 1V
10. Distortion Meter	Capability Input Level	3% or less at 1kHz 50mV to 10Vrms
11. Voltmeter	Measuring Range Input Impedance	10 to 1.5V DC or less 50kΩ/V or greater
12. 4Ω Dummy Load		Approx. 4Ω, 3W

The set has been adjusted for the frequencies shown in the following table. When required, re-adjust them following the adjustment procedure to obtain the frequencies you want in actual operation.

Type	RX freq' (MHz)	TX freq' (MHz)

**KMC-9 Specifications**

- Type ..... Uni-directional dynamic microphone (Preamplifier built-in)
- Output impedance .....  $600\Omega \pm 30\%$  (at 1kHz)
- Sensitivity .....  $-50\text{dB} \pm 3\text{dB}$  (at 1kHz,  $0\text{dB} = 1\text{V}/\mu\text{bar}$ )
- Frequency characteristic ..... 300 to 3000Hz ( $\pm 6\text{dB}$ )
- Power requirements ..... 13.8V DC (Supplied from the radio)
- Dimensions (W x H x D) ..... 70 x 162 x 150 mm (2-3/4 x 6-3/8 x 5-29/32 inch)
- Weight ..... 550g (1.2 lbs)

## SPECIFICATIONS

**GENERAL**

Frequency Range .....	150 to 174MHz : K,M,NM,AM 136 to 150MHz : K2,M2,NM2,AM2
Number of channels .....	1 : TKR-720/N    16 : TKR-720A
Channel Spacing .....	30kHz : K,K2 30kHz (25kHz) : M,M2,AM,AM2 12.5kHz : NM,NM2
PLL Channel Step .....	5kHz : TKR-720/A    6.25kHz : TKR-720N
Input Voltage .....	120/220V AC, 50/60Hz (Modifiable to DC backup)
Power Consumption .....	230W max.
Duty Cycle .....	50% at 50W output (100% at 15W output)
Temperature Range .....	-30°C to +60°C (-22°F to +140°F)
Dimensions .....	H : 4.72" (120mm) W : 12.99" (330mm) D : 15.08" (383mm)

## KENWOOD

SERVICE BULLETIN **Land Mobile Division**

**SUBJECT** TKR-720/820 CHANNEL SELECTION VIA THE ACCESSORY CONNECTOR

**DATE** 03/16/92

The TKR-720 and TKR-820 are normally programmed with one channel and up to 8 QT or DQT tones. The following information will allow selection of up to four channels from the accessory connector. Optionally, this capability also permits selection of the first 4 tones for use as default tones for dispatch purposes.

On TKR-820's prior to S/N 104XXXX, diode D19 and jumper J12 need to be installed on the Display board. The revised TKR-820 Service Manual, Part Number B51-8050-00, shows the proper location of these components. TKR-720's already include the parts necessary for channel selection via the accessory connector.

**PROCEDURE:**

1. Program channels 1 to 4 in the usual manner with the KPT-20.
2. Prepare a rectangular plug to be inserted into the accessory jack. The plug will require male crimp terminals, Part Number E23-0613-05, to be inserted into positions 1, 11, 14, and 15. Pin 1 is the hook line which must be grounded in order to change channels. Pin 11 is ground. Pins 14 and 15 are BCD channel selection lines. These lines are normally held "HI" with pull-up resistors on the Display board.
3. If selectable default tones are desired, program the Signaling board EEPROM accordingly with the KPT-20. The default tone is the tone encoded during transmit (PTT) when COR is NOT present. JAQ4 software (see Service Bulletin T-89-88-LM) must be used in the Signaling unit to facilitate default tone operation.
4. Connect a 3 pin wire harness (Part Number E31-3341-05) from the TX-RX board connector CN5 to the Signaling board connector CN3.

When arranged for selectable channels and default tones, the TKR-720/820 can be programmed with a common channel and different selectable default tones or vice versa. Any tone that is programmed (8 tones maximum), however, is available for repeat use regardless of the channel selected.

In order to change channels, pins 14 and 15 must be pulled low as follows:

	CH1	CH2	CH3	CH4
PIN 14	H	L	H	L
PIN 15	H	H	L	L

MALE PIN  
CRIMP TERMINALS  
(E23-0613-05)

THIS IS AN OPTIONAL CHANGE THAT IS NOT COVERED UNDER WARRANTY.

## NTE2547 (NPN) & NTE2548 (PNP) Silicon Complementary Transistors Darlington Driver

### Features:

- High DC Current Gain
- High Current Capacity and Wide ASO
- Low Saturation Voltage

### Applications:

- Motor Drivers
- Printer Hammer Drivers
- Relay Drivers
- Voltage Regulator Control

### Absolute Maximum Ratings: ( $T_A = +25^\circ\text{C}$ unless otherwise specified)

## NTE180 (PNP) & NTE181 (NPN)

### Silicon Power Transistor

### High Power Audio Amplifier

**Description:**

The NTE180 (PNP) and NTE181 (NPN) are silicon complementary transistors in a TO3 type case designed for use as output devices in complementary audio amplifiers to 100 watts music power per channel.

**Features:**

- High DC Current Gain:  $h_{FE} = 25 - 100 @ I_C = 7.5A$
- Excellent Safe Operating Area

**Absolute Maximum Ratings:**

Collector–Emitter Voltage, $V_{CER}$	100V
Collector–Base Voltage, $V_{CB}$	100V
Collector–Emitter Voltage, $V_{CEO}$	90V
Emitter–Base Voltage, $V_{EB}$	4V

## NTE352 Silicon NPN Transistor RF Power Amp, Driver

### **Description:**

The NTE352 is a 12.5V Class C epitaxial silicon NPN transistor in a W65 type package designed primarily for VHF, FM communications. Diffused emitter resistors provide high VSWR capability under rated operating conditions. Internal impedance matching ensures optimum power gain and efficiency over the 136–175MHz band.

### **Features:**

- 175MHz
- 12.5 Volts
- $P_{OUT} = 100$  Watts
- $G_P = 6.0$ dB Minimum
- Common Emitter Configuration

### **Absolute Maximum Ratings:** ( $T_C = +25^\circ\text{C}$ unless otherwise specified)

Collector–Base Voltage, $V_{CBO}$ .....	36V
Collector–Emitter Voltage, $V_{CEO}$ .....	18V
Collector–Emitter Voltage, $V_{CES}$ .....	36V
Emitter–Base Voltage, $V_{EBO}$ .....	4V
Collector Current (Peak), $I_C$ .....	20A
Power Dissipation, $P_D$ .....	270W
Operatin Junction Temperature, $T_J$ .....	+200°C
Storage Temperature Range, $T_{stg}$ .....	-65° to +150°C
Thermal Resistance, Junction–to–Case, $R_{thJC}$ .....	0.65°C/W

- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.
