CIRCUIT DESCRIPTION

RX SECTION

The input signal from the antenna passes through the transmitter/receiver diode switch on the Final unit before being input to the front end. The front end is comprised of RF amplifier Q1 (GaAs FET 3SK97 Q2), first mixer Q2 (3SK74L), a 3-pole helical resonator having a 4 MHz bandpass and a 2-stage MCF (Monolithic crystal filter) to give good sensitivity and two signal characteristics.

The first IF signal (10.695 MHz), having passed through the MCF, is mixed with the (10.240 MHz) second local oscillator signal at the second mixer Q3 (3SK74GR) to produce a second IF signal at 455 kHz. This (455 kHz) second IF signal is passed through ceramic filter CFW-455F, IF amplified by Q4 (TA7302P), Q5 (2SC2668Y), and Q6 (μ PC577H) and detected by ceramic discriminator CFY-455S. The (10.240 MHz) second local oscillator output is also used by the receiver PLL for the comparator reference signal.

The detected output from the discriminator is divided into an audio frequency component and a noise component and are then coupled into their respective circuits. The audio frequency component is de-emphasised, and preamplified by Q7 (2SC2458Y) before delivery to Q14 (MB3712), which is the power amplifier which drives the speaker. The noise component is derived through the BPF (bandpass filter), which detects the noise in the vicinity of 20 kHz. This is amplified by Q8 and Q9 (2SC3113B) and rectified by D5 and D6 to achieve squelch control. The squelch control signal is applied by Q10 (2SC2458Y) to control Q7. Q11 (2SA1115E) and Q12 (2SC3113B) are DC-amplifiers for the busy indicator. Q13 prevents transient "clicks" when the alert function operates and mutes the audio when the CTCSS is being used.

Item	Rating
Nominal center frequency	10.695 MHz
Pass bandwidth	$f_0 \pm 7.5$ kHz or more at 30 dB
Attenuation band	$f_0 \pm 25$ kHz or less at 40 dB $f_0 \pm 45$ kHz or less at 60 dB
Guaranteed attenuation	70 dB or more within $f_0 \pm 1$ MHz (Spurious level = 35 dB or more) 80 dB or more within $f_0 \pm (910 \text{ kHz} \pm 20 \text{ kHz})$
Ripple	1.0 dB or less
Loss	1.5 dB or less
Terminal impedance	3 k Ω 110PF

CIRCUIT DESCRIPTION

TX SECTION

The signal from the microphone is amplified by Q55 (NJM4558S) on the "B" unit (X53-1340-11, X53-1340-61), before being diode limited by D39 (MC911) where IDC (instantaneous deviation control) is provided to prevent over-deviation. Then LPF (lowpass filter) Q54 (NJM 4558S) filters the higher frequencies and phase-modulates the transmitter PLL loop.

The phase-modulated FM signal is passed through VCO buffer Q45 (2SC2668Y) before being amplified by drive Q46 (2SC2347) and Q47 (2SC2538) to yield the output for the Final unit.

The signal fed to the Final unit (X45-1330-11) is power amplified by power hybrid Q1 (M57737). The signal is then passed through the transmitter/receiver diode switch before going through 3-stage LPF and is then fed to the antenna.

and is then fed to the antenna. The APC (automatic power control) circuit performs HI/LOW power control selection and SWR protection. The output from the power module is sampled through C8 and detected by D4 before being applied to unit "B", where the signal is applied through Q53 (2SC2458Y) and then to differential amplifier Q50 and Q51 (2SC2458Y). The protection circuit detects the reflected wave from the antenna terminal, which is amplified by Q52 (2SC2458Y) on the "B" unit before being applied to differential amplifier pair Q50 and Q51. The differential amplifier controls Q49 (2SA1015Y) and Q48 (2SC880) and varies the voltage at Q1 pin 2 on the Final unit and at Q47 on unit "B", thereby controlling the output of the transmitter.

Table 4 Power Module M57737 max rating and electrical characteristic

PLL SECTION

The PLL circuit is comprised of two loops: one for transmission and one for reception. The block diagram is given in Fig. 6.

Receiver PLL

The signal generated by RX VCO Q27 (2SK125) on "A" unit (X44-1530-11) (133.305-137.295 MHz) is mixed by Q22 (2SC2668Y) to become a PLL signal at 10.97-14.96 MHz. This is amplified by Q23 (2SC2668Y) and then input to PD (phase detector) IC Q19 (MC145155P). The 40.1116 MHz heterodyne signal generated by Q20 (2SC2668Y) is tripled to 122.335 MHz by Q21 (2SC2787L) before being input to mixer transistor Q22. When the PLL IF signal is input to Q19 (pin 9), it is divided by a ratio of N=2194~2592, specified by the data from microprocessor Q1 (μPD7508G-534). Simultaneously, the 10.24 MHz signal generated by Q30 is buffered by Q31 and is then divided by 1/2048 to become the 5 kHz reference comparison signal.

The phase compared output signal is passed through LPF Q25 and Q26 (2SC2459BL) and is applied as the VCO control voltage to varicap D12 (1S2208), then locked to the desired frequency. If the PLL loop unlocks, the unlock signal from Q19 (pin 8) turns off Q24 (2SC2458Y), which in turn stops the operation of VCO buffer amplifier Q29.

Transmitter PLL

The signal generated by TX VCO Q44 (2SK125) on "B" unit (144.00-145.990 MHz) is mixed with the RX PLL output signal (133.305-135.295 MHz) at mixer Q35 (2SC2668Y) to become a 10.695 MHz signal. This is amplified by Q36

TM-201A

CIRCUIT DESCRIPTION

LED DRIVE CIRCUIT

The LED drive system consists of 4-digit LEDs. The segment signal is output at ports P20 - P23 and P40 - P43 of the microprocessor Q1 and driven by digital transistors Q10. The digit signal is output at port P30 - P33 and driven by digital transistor Q8. The 2 dots (MHz decimal point and A,B) of the frequency display and MR and ALARM LEDs are driven dynamically.

Fig. 9

Fig. 10 Digital TR DTC143T (E) (B unit: Q10 ~ 17)

Encoder

The mechanical contact system encoder outputs 25 pulses with 50 clicks at one cycle. The chattering component in the encoder output is eliminated by Schmitt circuit Q7 and directly applied to ports P62 and P63 of the microprocessor. The UP/DOWN operation of the encoder are judged by the microprocessor software.

Switch signal

The key scan output pulse is used in common with the display digit signal and the key return signal is input to ports P10 - P13. The key scan signal is stopped by the AND gate Q6 so that it is not output in transmission mode.

Fig. 11 Key matrix

Beep sound

The beep signal is switched by the 3-stage inverter Q2 and NAND gate Q3. The oscillation frequency is determined by C7 and R5.

Back-up circuit

The AVR output of Q5 is switched by Q4 and fed to P00. When the AVR voltage drops and approaches the lithium battery voltage, the P00 becomes L level, the unit enters the back-up mode, clocks CL1 and CL2 stop and the unit enters the low current hold mode.

Frequency controller FC-10 interface

The LCD display data supplied from the unit to FC-10 is output at ports P01, P02 and P61 and amplified by inverter buffer Q2. The 3-bit keyboard information (R0, R1 and R2 of J21) is supplied from FC-10 and R0 and R1 are combined with the mic UP/DOWN signal and input to port P50 - P52.

CIRCUIT DESCRIPTION

2SC2668Y) before being input to PD IC Q38 (MC145151P) pin 27. Concurrently, the 10.695 MHz reference signal generated by Q37 (2SC2668Y) is divided in PD IC Q38 by 1:512 to become the 20.98 kHz phase reference comparison signal. The compared and phase-locked output signal is passed through LPF Q39-Q41 (2SC 2459BL) and applied as the

VCO control voltage to varicap D36 (1SV50), to lock the VCO to the desired frequency. If the PLL loop unlocks, the unlock signal from Q38 (pin 28) turns off Q42 (2SC 2453Y), which then turns off Q43 (2SA 1015Y). The result is that no bias is applied to Q45-Q47 and transmitter output is inhibited.

Fig. 13

Replacement procedure

When replace the back-up battery read as follows.

1. Remove the lower case.
2. Take care not to damage parts on the PC board since they are soldered battery.
3. Remount cell again (conform to cell pole).
4. After power switch is on, push the reset switch is on.

PRECAUTIONS FOR HANDLING GALLIUM ARSE-NIDE FET's (GaAs FET)

The gallium arsenide FET (3SK97) used in this device is easily damaged by static electricity. Take careful note of the following points when soldering and handling this device.

1. When handling this FET separated from the radio, make sure to first discharge yourself to ground.
2. Use a grounded-tip soldering iron.
3. Ground the FET while soldering-in.
4. Cover the work table with a conductive, grounded panel to insure an adequate static discharge path.

M-201A

DISASSEMBLY

DISASSEMBLY FOR UPPER CASE

- ❶ To loosen the side escutcheon's (L & R) screw (5 pieces).
- ❷ Remove upper case is screw (2 pieces).

DISASSEMBLY FOR LOWER CASE

- ❶ To loosen the side escutcheon's (L & R) screw (5 pieces).
- ❷ Remove lower case's screw (5 pieces).

DISASSEMBLY FOR DISPLAY UNIT

- ❶ Remove side escutcheon's (R & L), remove knob (AF, SQ, MAIN).
- ❷ To remove the subpanel from the chassis, remove 4 screw.
- ❸ Remove connector.
- ❹ Remove the DISPLAY PC board is screws (4 pieces).

DISASSEMBLY FOR FRONT PANEL

- ❶ Remove side escutcheon's (L & R) knob & nut.
- ❷ To remove the sub-panel from the chassis. Remove 4 screw's.
- ❸ Remove connector.
- ❹ Remove front panel's screw's (2 pieces).

TM-201A

DISASSEMBLY

REMOVING A UNIT

- Remove the A PC board's screws (11 pieces).
- Remove connector (No. 3) and coax. cable (RA).

REMOVING B UNIT

- 1 Remove connector (No. 9, 10, 11, 29) and coax. cable (DO).
- 2 Remove PC board's screw (8 pieces) and round boss (2 pieces).

TM-201A DISASSEMBLY

TM-201A

DISASSEMBLY/DIMENSIONS

COAX. CONNECTOR REPLACEMENT

- 1 Remove side escutcheon (L & R).
- 2 Remove final heat sink's screw (3 pieces).
- 3 Remove connector.

- 4 Remove the coax. fitting hardware on final unit.
- 5 Resolder coax. cable.
- 6 Remove cordbush, remove coax. connector.

ADJUSTMENT

PREPARATION

Unless otherwise specified, Set the control as follows.

- POWER SW.....ON
- VOLUME.....MIN
- ATTEN SW.....MIN
- AGC SW.....HI
- COM SW.....OFF
- STSS.....OFF
- RF.....OFF
- REC.A.B SW.....A

- When adjusting the trimmer or coils, use a non-induced adjusting rod of bakelite, etc.
- When adjusting the RX section never transmit to prevent SSG damage.
- The output level of SSG is indicated as SSG "s" open circuit.
- Connect MIC connector as shown in Fig. 18.

Fig. 18 MIC terminals (view from front panel side)

RX ADJUSTMENT

Item	Condition	Measurement			Adjustment		Specifications	
		Test equipment	Unit	Terminal	Unit	Part		Method
1) Meter	1) Push switch S1 ON on B unit (near Lithium cell)	DISPLAY					Check	4.00

SPECIFICATIONS

Dimensions: W: 112 mm (4-13/32") x H: 35 mm (1-13/32") x D: 22.5 mm (29/32")
 Weight: 100 g
 Cable length: 1.5 m

APPLICATION

TM-201A : 2 m transceiver
 TM-401A : 70 cm transceiver

CIRCUIT DESCRIPTION

In the switch unit, a diode matrix is constructed with D2 - D4 in order to convert 5 keys into a 3-bit code. The output of the matrix is fed to the main unit after it is turned over and amplified by the inverter Q1.

In the LCD unit, the LCD display data is reshaped in wave form by the Schmit inverter Q102 and fed to Q101. The LCD data is a serial data of 3-bit and 32 bits are transferred at a time. The Q101 has a latch storing data is changed. The LCD display employs a static illumination system.

21 MSM5829GS function table

- Note: 1. H: Display state. The phase of this output is opposite to that of the COM pin output.
 L: Nondisplay state. The phase of this output is the same as that of the COM pin output.
 2. BI/RBO is "L" only when RBI is "L" and all digits are 0 (blank display). When BI/RBO pin is forced to logic "H", 0 is displayed at the least significant digit.
 3. When BI/RBO is forced to logic "L", only the least significant digit blanks.
 4. When RBI is set to logic "L", the leading zeros are suppressed, i.e., the continuous zeros, if any, at the most significant digit down are blanked.

Maximum frequency
 deviation (FM) \pm 5kHz
 Audio distortion3% max. (300 Hz ~ 3000 Hz)

[Receiver]

CircuitryDouble superheterodyne
 Intermediate frequency1st 10.695 MHz
 2nd 455 kHz
 Receiver sensitivitySINAD 12 dB less than
 0.22 μ V (K, M) 0.2 μ V (T, W)
 S+N/N more than 50 dB at
 1.0 mV input
 Receiver selectivityMore than 12 kHz (-6 dB)
 Less than 24 kHz (-60 dB)
 Spurious responseBetter than 70 dB
 (except f_0 -IF/2)
 Squelch sensitivityLess than 0.16 μ V (threshold)
 Auto scan stop levelLess than 0.2 μ V (threshold)
 Audio outputMore than 2.0 watts across
 8 ohms load (5% dist.)

[Auto patch microphone

(MC-48) supplied] — For U.S.A. version only

SemiconductorsIC 1
 Transistors 3
 Diodes 3
 Impedance500 ohms
