CHASSIS REMOVAL

To remove the chassis from the case, use the following procedure.

1. Remove rear cover.
2. Rotate TUNING knob until dial pointer lies between 535 kHz and 600 kHz on the AM band. Loosen screw on dial pointer slide and remove dial cord from the pointer.
3. Remove all knobs.
4. To release the chassis from the case, remove eight screws and three nuts shown in figure 7. Slide chassis out as far as the interconnecting leads will allow. These leads are long enough to permit the receiver chassis to swing to a horizontal position, with the battery holder placed under the speaker magnet.

DIAL CORD RESTRINGING

To restring the dial cord, remove the chassis following instructions given in the preceding paragraph and proceed as follows:

1. Position TUNING drum as shown in figure 2.
2. Tie one end of dial cord to plastic stud at numbered step 1 (figure 2).
3. Proceed to restring in ascending numerical sequence as shown in figure 2. Finish restringing with numbered step 8 and attach free end of string to plastic stud on TUNING drum. Sufficient tension should exist on spring to prevent cord slippage.

ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED

1. AM Signal Generator covering 180 kHz to 12 MHz, with 75-ohm output impedance.
2. FM Signal Generator covering 80 to 180 MHz, with 75-ohm output impedance.

Figure 2. Dial Cord Restraining Diagram.

3. FM Sweep Generator capable of producing 500 kHz deviation centered at 10.7 MHz, with a sweep marker set at 10.7 MHz.

4. Audio Output Meter with 8-ohm input impedance or ac VTVM.
5. Wideband Oscilloscope of tv alignment type.
6. Tuning wand with iron and brass ends.
7. Nonmetallic alignment tool.

PREALIGNMENT NOTES

1. Set VOLUME control to maximum and TONE switch to LOW position.
2. Set am signal generator to produce 30 percent amplitude modulation.
3. Set fm signal generator to produce an on-frequency output with ± 22.5 kHz deviation.
4. Set fm sweep generator to produce a deviation of 500 kHz (± 250 kHz) centered at 10.7 MHz. Set marker to 10.7 MHz.
5. Set Audio Output Meter to its most sensitive range and use the lowest signal generator output producing a 10 dB S/N ratio.
6. Make all adjustments for a maximum indication on the Audio Output Meter (connected to the external speaker jack) EXCEPT for FM-VHF IF alignment.
