OWNERS GUIDE

MODEL S-118 MARK II
FIVE BAND
COMMUNICATIONS RECEIVER

GET SET FOR EXCITING ADVENTURES
OUT OF THIN AIR.
AS YOU TUNE IN THE WORLD
ON YOUR *hallicrafters* COMMUNICATIONS RECEIVER

From the grim wilderness of a remote village in the central Congo the voice of a missionary cries out, "Please hurry . . . we need help . . . there's no time

A hair's breadth away another voice--almost monotonous in its calm business-like, professional manner, booms in--"Charlie base this is Air Force Zebra Two Nine Bravo target bearing Zero-Three-Zero angels fiv-two Roger, I have him in sight . . ."

From a bomber over the Aleutians to the darkest reaches of Africa from a satellite in outer space to America's nuclear submarines voices like these, the voices of modern pioneers of adventure, are yours to command with a twist of the dial, in your own living room

This is the amazing world of Short Wave Listening--an exciting world, a serious world, a world of infinite variety

Only by short wave radio can you become a witness to history as it occurs

And only through short wave can you hear, in a single day a Wagnerian opera from Heidelberg . . . a news broadcast from behind the Iron curtain and an airport control tower bringing in a crippled plane!

Every moment of every day and night, Short Wave brings into your home an absorbing new interest--a fascinating way to keep up with international affairs, to be informed and stay informed.

This book was prepared to give you a quick and thorough Guided Tour of Short Wave, and to help you enjoy more fully this wonderfully informative pastime

Good listening!

HOW SHORT WAVE ... LONG WAVE BROADCASTING WORKS

Understanding the mechanics of short-wave radio will help you receive the most enjoyment and the greatest thrills for the hours you spend at the dials.

You may often have heard the term *wave length* applied to the radio signals transmitted by a broadcasting station. Radio signals travel in waves; the wave length is the distance between the *crests* of the waves.

The total number of complete waves (or cycles) that a station can send out per second is referred to as *frequency*. The broadcasting frequency, therefore, is determined by the wave length on which a particular station is transmitting. The shorter the wave length, the higher the frequency.

Every radio station in the world is licensed to broadcast on certain assigned frequencies or bands of frequencies.

The standard broadcasting stations such as those in your home town are assigned to lower frequencies, or longer wave lengths. The high-frequency bands are reserved for other types of transmitting stations throughout the world known as *Short-Wave Stations*.

Why Short Wave Is Used For Long Distance Transmission

The chief characteristic of short waves is their amazing ability to span enormous distances.

The illustration shows the manner in which all radio signals travel in waves as they leave the transmitter antenna. Some of the signals hug the ground while the rest travels upward and outward away from the earth.

You are able to hear short-wave radio signals over great distances because they are refracted back to earth from layers of rarified gases high in the ionosphere. Short-wave signals enter the ionosphere and are refracted (bent) by the layer's electrical particles.

The physical action is similar to skipping a stone on smooth water. If the stone is of the correct size and shape and is thrown with enough power at the right angle, it will skip over the water's surface. The short-wave signal finds the ionosphere just as particular.

Similarly, the short-wave signal must be of the right size (frequency)

It must strike or enter the ionosphere at precisely the correct angle and it must have sufficient power.

It may take several skips (just like a stone) for the signal to travel from the distant transmitter to your receiver. With each consecutive bounce, the signal becomes weaker until it is too weak to continue its process of refracting from the ionosphere back to earth (where it is heard), back off the earth into the ionosphere, and then again back to earth.

At different periods of the year, short-wave reception improves above the normal range between your receiving site and various areas of the world. As an example, the Spring months bring the strongest signals from Australia and the South Pacific. In the fall months, signals from Europe and the Far East dominate the dials. Also as daylight comes into darkness each day between your receiving location and the transmitting station, so does the nature of the reception. Day-to-day variations are also present.

What You May Hear On The Short Wave Bands

The Short Wave Bands are your passport to a world of exciting adventures

AMATEUR RADIO Amateur (ham) radio stations are operated by private citizens in more than 250 countries around the globe

Amateurs talk to other amateur operators for personal pleasure or experimentation. No business or commercial transactions are permitted over stations operating in this service. Hams are allowed to operate on any frequency within assigned bands. The most commonly used are the 80-meter band; and the 40-, 20-, 15-, and 10-meter bands. (See page 9 for an explanation of the relationship between megacycles and meters.)

SHIP-TO-SHORE, MOBILE RADIO-TELEPHONE Essentially a telephone without wires. Operated by telephone companies and businesses who lease transmitters and receivers to individuals.

Listen at approximately 2.1 MC

AERONAUTICAL-AIRPLANES-AIRPORTS - Weather information, flight conditions, re-routing of planes in time of bad weather. General communications between planes and stations on the ground.

You will find signals in this service at approximately 2.6, 2.9 to 3.0, 4.1, and at approximately 7.6 MC

MILITARY Air Force, Army, Navy, Marine, and Coast Guard communications may be heard between ground stations and planes or vehicles 24 hours a day. These signals may be heard throughout the short-wave frequency range.

MARITIME MOBILE. In addition to military naval forces, commercial vessels, fishing fleets, and pleasure craft regularly communicate routine and emergency messages on short wave. These may be heard in the ranges from 2 to 3 MC, 4 to 4.4 MC, 6.2 to 6.5 MC, and 8.1 to 8.6 MC

CITIZENS BAND Low-cost, two-way radio now available to private citizens on the 11-meter band. More than 1,000,000 U.S. citizens are expected to be operating citizen-band transmitters. No operator's license is required. You will find the 11-meter band at approximately 27 MC

INTERNATIONAL SHORT-WAVE BROADCASTING Of all of the services you'll meet on short wave international broadcasting offers the most varied entertainment. Many governments operate powerful short-wave transmitters (e.g., the U.S. Government's Voice of America) to keep the world informed of activities within their countries. Many countries also license commercial short-wave stations, and in fact, many regions of the world conduct much of their daily broadcasting on short wave, instead of the standard broadcast band. Major frequency assignments are indicated by the dots located in the upper portion of the bands. For specific stations and frequencies consult your Station Log.

STANDARD TIME SIGNALS WWV United States National Bureau of Standards broadcasts the correct time with voice as well as code identification. The identification occurs during the last two minutes of each 5 minute period (i.e., 03 to 05, 08 to 10, 13 to 15, etc). Other checks such as radio frequency, audio frequency, and forecast of conditions which will affect radio reception are broadcast. WWV will be found at 2.5, 5.0, 10.0, 15.0, 20.0, and 25.0 MC

How to Set Up Your Receiver

Your Hallicrafters Model S-118 Mark II is a Communication Receiver designed and manufactured to the most stringent quality standards. It has been packaged to insure safe arrival.

First, carefully lift the receiver out of the shipping carton and remove the specially coated wrapping paper.

Inspect the receiver for any visible damage.

Decide where you want to set up the receiver. In making your decision, you should consider several things:

- 1 ● **YOUR COMFORT** You will spend many fascinating hours with your receiver. Be sure you place it where you will be able to enjoy tuning and listening at any time.
- 2 ● **YOUR ANTENNA** The first time you turn the receiver on and start your adventure in short wave listening you will most likely be using a 15-foot length of antenna wire. As you get more experience and begin reaching out for more distant stations you may want to set up an outside antenna. With this in mind, try to choose a location which is near a window or outside wall.
- 3 ● **YOUR GROUND** Should you progress to an outside antenna it is GOOD PRACTICE TO GROUND YOUR SET FOR SAFETY. This will require running a ground wire from the ground connection on the back of the receiver to a cold water pipe or to a metal pipe driven into the earth.

Now let's set up the SHORT WAVE antennas needed to operate your receiver. Attach the length of antenna wire to terminal marked A. Extend it about the room or out a window.

Your LW and AM (BROADCAST BAND) antenna (Band 1 and Band 2) is already built into your receiver. No setup is required.

To complete your initial installation, plug your receiver into an electrical outlet which provides 105- to 125-volt, 50/60-cycle, AC only. Power consumption is 33 watts. This is the type of electrical supply common throughout the United States.

Now let's look at some of your receiver features and controls.

hallicrafters MODEL S-118 MARK II FIVE BAND COMM

COVERAGE: The S-118 Mark II receiver has five individual bands: a Long Wave Band covering 150 KC to 410 KC, a Broadcast Band covering 500 KC to 1800 KC, plus three Short Wave Bands which provide continuous coverage from 1.7 MC to 21 MC.

BAND 1 - Long Wave reception covering commercial and marine weather and navigation reports.

BAND 2 - Standard AM Broadcast station reception. The international distress frequency may be received on 500 KC.

BAND 3 - Spans 1.7 to 4.6 megacycles (MC) range. Marine and aviation broadcasts and western hemisphere weather forecasts can be heard on this band. The exact time (indicated by world time standard station WWV) may be tuned in at 2.5 MC. The extra time beginning at 3.5 MC is the 80-meter amateur radio band. All extra times (other lines) located above the main lines of bands 2 through 5 designate the amateur radio bands in meters. (Page 4 inside for the meter-to-megacycle relationships.)

BAND 4 - covers 5.0 to 14 megacycles (MC). This short wave band carries international broadcasts from distant countries, the 40- and 20-meter amateur radio bands, and WWV located at 5 and 10 MC.

BAND 5 - includes 15 to 20 megacycles (MC). International broadcasts time news pieces can be found in this band in addition to the 15- and 10-meter amateur radio bands and all seven band stations. WWV time can be checked on this band at 15, 20, and 25 MC.

SPEAKER: 4-in. permanent magnet, 2.7-ohm voice coil.

PHONES: Front panel jack for plugging in any commercial low-impedance headphones ranging from 2 to 2000 ohms. With headphones plugged in the receiver, the built-in speaker will be disconnected.

SENSITIVITY CONTROL: Control set fully clockwise for maximum sensitivity. Should hiss or background noise be heard, or strong signals cause distortion, reduce the sensitivity by turning the control slowly counterclockwise. If this action reduces volume, advance the VOLUME control.

REC-STRY SWITCH: Normally set to REC (received). When in STRY (stray) position, the receiver is ON and remains at listening temperature, but the speaker or headphones will be disconnected and sound is heard. The STRY feature allows thorough and vibrant warming of the tubes for more accurate and consistently tuned stations. With the receiver properly tuned in, the STRY feature permits clearing of the receiver and instant return of frequency to REC.

BAND SELECTOR CONTROL: When the indicator knob indicates the corresponding band on the dial, the receiver is being tuned.

OFF

OFF-
mark
indicated
Allow
to align
to 50

COMMUNICATIONS RECEIVER

Identification of features and controls

OFF-B.F.O. SWITCH: This switch is primarily used to provide the necessary beat frequency tone when receiving CW (code) signals, or single sideband. Set it to the OFF position for AM broadcast reception and ON for CW signals. When listening to CW signals, advance the VOLUME control to maximum clockwise and adjust the SENSITIVITY control to a comfortable volume level. Many voice stations that transmit on the Single-Sideband Suppress Carrier Transmission. In order to receive this type signal, it will be necessary to switch B.F.O. ON. Tuning will be quite critical. The SENSITIVITY control should be set toward minimum and the VOLUME control advanced toward maximum.

LOGGING SCALE: Professional micro-meter type scale which reads in one-hundredths of a megacycle. The yellow pointer, moved by the BANDSPREAD control, indicates reading on the LOGGING SCALE.

BANDSPREAD CONTROL: Similar to a fine tuning control, only far more sensitive. Use for fine tuning after using Main Tuning Control to move red pointer to approximate location of station you wish to receive. Electrically expands Q reading 100 times. Control moves yellow pointer on LOGGING SCALE.

TUNING CONTROL: Use for regular or fast tuning. Moves red pointer to dial markings. Adequate for tuning most standard broadcast stations and for scanning the Short Wave Bands.

SPECIFICATIONS

ANTENNAS: Self-contained ferrite loopstick for Bands 1 and Band 2 (broadcast). Two contact, screw-type terminal strip on rear panel for external antenna of 55 ohms to 500 ohms impedance for Bands 3, Band 4, and Band 5.

TUBES: Five: 6BL6 Wave, 12BA6 F Amplifier, 12BA6 IF Amplifier, 6F6, 12AV6 First Audio Detector, ANL.

ANL: 6AD5A Audio Output; plus two silicon diodes.

PANEL LAMPS: Two each NO. 44.

PHYSICAL DATA: Gray metal cabinet with silver trim. Size: 6-3/8 inches high by 14-1/2 inches wide by 8-3/4 inches deep. Approximate weight: 15 pounds.

OFF-ON/VOLUME CONTROL

OFF-ON/VOLUME CONTROL: Turn receiver ON clockwise and OFF counterclockwise. Volume is increased as control is turned in the clockwise direction. Allow one minute for warmup after turning receiver ON. A slight hum is normal. To cut hum, disconnect the plug to the electrical outlet to which the receiver is plugged.

OFF-ANL SWITCH: This switch is normally set at OFF. To increase intelligibility with reception, place the switch in the ANL position. This will reduce interference. However, some distortion of speech and music reproduction may result.

hallicrafters

How to Operate Your Receiver

Some of the basics, such as setting up your receiver and plugging it in, have already been covered. Now you are ready to start listening. Here's how:

A good way to become familiar with your receiver is to first try it out on Band 2, the Standard AM Broadcast Band. You will find that stations with which you are familiar come in loud and clear. You will also discover many other stations which you may never have heard before.

Getting Ready to Tune Your Receiver

1. Turn receiver ON by turning the OFF/VOLUME Control to the right. The dial will light up.
2. Place the REC/STBY Switch into the REC position.
3. Place the BFO switch in the OFF position.
4. Turn the BANDSPREAD Control until the short yellow pointer is at 0 on the LOGGING SCALE.
5. Select the band to which you wish to tune by turning the BAND SELECTOR Control to the appropriate band number.

Tuning Long Wave (Band 1) and AM Broadcast (Band 2)

1. Turn BAND SELECTOR Control to the Band 1 or Band 2 setting.
2. Using the TUNING Control, move the red pointer to the station frequency desired.

Tuning Short Wave Stations

The transmission of short wave signals is a more precise operation. Reception of these signals is subject to several things which are, for the most part, beyond the control of your receiver. These are: 1) atmospheric conditions such as solar disturbances which can help make a signal come in loud and clear, reduce signal strength and clarity or even block it out completely, 2) day-to-night and month-to-month atmospheric variance, and 3) your skill as a Short Wave Listener in tuning your receiver. These skills are quickly developed, however, and a good way to start is Dial Scanning.

Dial Scanning Method

1. Select the band you wish to scan (by tuning through the entire band) by turning the BAND SELECTOR Control to Band 3, 4, or 5.
2. Adjust the yellow pointer on the LOGGING SCALE to about 0 by turning the BANDSPREAD Control.
3. Slowly move the red pointer across the dial, using the TUNING Control. You will alternately hear nothing, a few squeals, and then dots and dashes, voice, or music.
4. After you have tuned in as fine as you can with the TUNING Control, use the BANDSPREAD Control. Slowly move the yellow pointer, first from 0 to +50, and then down through 0 toward -50 until you bring a station in clearly.
5. You will notice as you scan the dial you can hear CW code (dots and dashes). If you wish to hear the code with the clarity required to read it, turn the BFO switch ON and adjust the SENSITIVITY control to the point which gives the clearest tone. You can make the tone sound higher or lower by turning the BANDSPREAD Control.

- 6 By waiting until the station identifies itself, you can log the station call letters, country and city of origin, transmitting frequency, and the time of reception so that you can tune in again at a later date. (See Station Log starting on Page 11.) For future location of the station, note the numbers indicated by the red and yellow pointers. For example: if the Band frequency is indicated as 8.0 and the LOGGING SCALE yellow pointer shows +22, the dial location should be logged as 8.022.

TUNING A SPECIFIC STATION follows the same steps as for Dial Scanning, except that you start with a specific frequency selected from your Station Log (see page 11). For example: if you wish to tune Radio MOSCOW you will see that one of the frequencies is 9.805. Taking 9.805 to demonstrate, you would:

- 1 Turn the BAND SELECTOR Control to Band 4.
- 2 Make sure the yellow LOGGING SCALE pointer is at 0.
- 3 Move the red pointer slightly above 8.8 on Band 4 with the TUNING Control.
- 4 Then, with the BANDSPREAD Control, slowly move the yellow pointer from 0 on the LOGGING SCALE to the vicinity of +5. NOTE: You may find that the station comes in a little below or above the +5 mark on the scale. Adjust if you wish.
- 5 Procedure for using the BFO switch for CW (code) or VOICE or MUSIC reception is the same as in Dial Scanning.

Questions on Service or Operation

Most service problems are relatively minor. For example: if you hear a disturbing buzz, when trying to tune in a weak station, chances are it is being caused by a fluorescent light. Look for the cause and, if you can, turn it off.

If the receiver is ON, but you hear nothing, look to see if the REC/STBY Switch is in the Receive position.

When you turn the OFF/VOLUME Control to ON and nothing happens, look to see if the receiver is securely plugged into the electrical outlet.

If signals are coming in very weak, check to see if your antenna wire is securely connected.

For further information regarding operation or servicing of this equipment, contact the dealer from whom the unit was purchased. The Hallicrafters Company maintains an extensive system of Authorized Service Centers where any required service will be performed promptly and efficiently at no charge if this equipment is delivered to the service center within 90 days from date of purchase by the original buyer and the defect falls within the terms of the warranty. It is necessary to present the Bill-of-Sale in order to establish warranty status. After the expiration of the warranty, repairs will be made for a nominal charge. All Hallicrafters' Authorized Service Centers display the sign shown at the right. For the location of the one nearest you, consult your dealer or your local telephone directory.

No service shipments should be made to the factory, unless instructed to do so by letter, as The Hallicrafters Company will not accept the responsibility for unauthorized shipments.

The Hallicrafters Company reserves the privilege of making revisions in current production of equipment and assumes no obligation to incorporate such revisions in earlier models.

and cishr

THE ANTENNA

All short-wave receivers need an antenna. A better antenna will receive signals that are weak and far away. Chances are you'll do very well with the antennas provided.

More elaborate antennas generally are built either to operate on one frequency, or to perform with effective results over a wide band of frequencies.

Because most listeners want results on all short-wave frequencies covered by their receiver, a suitable antenna for general coverage is illustrated.

This antenna will produce the best reception when it is mounted high and clear away from power lines, trees, and surrounding objects.

Listeners desiring specific design information on more specialized antennas are referred to the "A.R.R.L. Antenna Book" published by the American Radio Relay League.

Megacycles to Meters

All modern communication receivers are calibrated in megacycles. None the less, it is sometimes helpful to know what meter band corresponds to 11.866 megacycles for example. This is particularly true when tuning the International Short Wave Broadcasting stations who often announce only in meters. Megacycles may be converted to meters through the use of this simple formula:

$$300/\text{Megacycles} = \text{Meters}$$

For example:

$$300/11.866 = 25.28$$

or 11.866 MC = 25.28 meters

The conversion from meters to megacycles uses the same formula:

$$300/\text{meters} = \text{megacycles}$$

For example:

$$25.28 \text{ meters}$$

$$300/25.28 = 11.866 \text{ MC}$$

Reference Material

Here are sources through whom a log book with listing of foreign and local stations, as well as other information of interest to both radio and short-wave listeners, may be obtained:

AMERICAN RADIO RELAY LEAGUE, 38 La Salle Rd., West Hartford, Conn. Official organization of radio amateurs in the U.S. Free Literature. Special publications on how to become a radio amateur.

WORLD RADIO HANDBOOK, available through Gilfer Associates, BLX 239, Park Ridge, New Jersey. Yearly handbook of all short-wave stations, printed in Denmark.

POPULAR ELECTRONICS, 1 Park Avenue, N.Y. 16, N.Y. Monthly magazine available on newsstands. General news and features for the electronics hobbyist; excellent regular column on short-wave listening plus occasional SWL feature stories.

TIME AND INTERNATIONAL BROADCASTING

Communications time is told on a 24-hour clock. One AM is 0100; 4 AM is 0400, Noon is 1200; 3:30 PM is 1530; 8:45 PM is 2045, etc. With this method, there can be no confusion between AM and PM.

The base for telling time in International Broadcasting is Greenwich Mean Time, GMT, the time at Greenwich Observatory in England.

Converting from GMT to a local time zone is accomplished by adding or subtracting the hours shown on the INTERNATIONAL TIME MAP. For example: 1000 GMT is 0400 in CST (Central Standard Time).

Conversion from GMT to any other time zone is likewise accomplished by adding or subtracting hours. The chart for this is shown at the bottom line on the INTERNATIONAL TIME MAP.

International Station Log

Instructions for use --- International Station Log

Short wave listeners will find the following pages of great use in spotting and identifying international short-wave broadcasting stations operating from locations around the globe. The "Log" is prepared by broadcast frequencies. A column is provided for listing "Local Time Heard". Conversion from GMT to local time is explained above.

Stations listed in the log can be heard by listeners throughout the North American Continent. Transmission periods vary throughout the day and night. All broadcasts are in the English language unless otherwise indicated.

Column five, **TYPE PROGRAM** is included in the log so that you may list the type of broadcast you heard. The following abbreviations will be of assistance in filling out that column.

NE News in the English language ML - Music, English
 EI Commentary in English MS - Music, Spanish
 SI Commentary in Spanish. MN - Music, native to the country of location.
 ND - Indicates station does not broadcast daily.

In addition to the transmissions listed in the log, you will hear many English language broadcasts from such countries as Canada, Great Britain, and the United States. Because of the great volume of such broadcasts, and as they are easily heard without consulting a prepared guide, we have listed only a few such stations.

the new ideas in electronics

are born at hallicrafters

Precision Amateur Radio ♦ One of the few remaining avenues of uncensored personal communication among the peoples of the world is amateur radio. Hundreds of thousands of individuals from all walks of life, in 92 nations of the world (over half in the United States alone) devote much of their spare time to this fascinating and useful activity. Far more than a hobby, "ham" radio is America's front line of defense in communication in times of national emergency or disaster. Hallicrafters manufactures more precision communications equipment for the amateur than any other company in the world. Its technological leadership has been acknowledged for 30 years.

Personal Communication ♦ In this age of exotic communications, space probes and satellites, has come a simple but tremendously important opportunity for private citizens to communicate. It is called Citizens Band Radio.

Any adult with a need for personal two-way radio communication can own and operate a citizens band radio. No operator's license is required, only an easily-obtained station license, making it ideal for business and professional men who must be away from their phones frequently.

Nearly a million sets are now in use in homes, offices, cars, factories, boats, and in industry. From its earliest stages, Hallicrafters has been

a pioneer in Citizens Band Radio. Many of the major technical developments have come from Hallicrafters' electronic research laboratories. Today's Hallicrafters Citizens Band Radios are setting industry standards for compactness, for versatility, and outstanding performance.

Here, once again, is a working demonstration of new ideas in electronics, born at Hallicrafters for you.

Aerospace Electronics ♦ For a quarter century Hallicrafters has played a significant and special role in America's military defense. In addition to its widely used military communications equipment, Hallicrafters pioneered with the United States Air Force in the development of special research and development techniques known as "QRC," or Quick Reaction Capability, which have kept America ahead in the critical race for supremacy in electronic counter measures, reconnaissance, and other electronics warfare equipment. Today, advanced devices designed and manufactured by Hallicrafters aerospace division are at work in every phase of missile development from tracking system to nose cone.

hallicrafters

WARRANTY

The Hallicrafters Company warrants its products to be free from defective material and workmanship and agrees to remedy any such defect or to furnish a new part in exchange for any part of any unit which under normal installation, use and service discloses such defect, provided the unit is delivered by the owner to our authorized radio dealer, wholesaler, new unit purchaser, or authorized service center, intact, for examination, with all transportation charges prepaid within sixty days from the date of sale to original purchaser and provided that such examination discloses to our judgment that it is thus defective.

This warranty does not extend to any of our radio products which have been subjected to misuse, neglect, accident, incorrect wiring and use, improper installation, or to any in violation of instructions furnished by us, nor extended to units which have been repaired at altered outside of our factory or authorized service center, nor to cases where the serial number (shown) has been removed, defaced or changed, nor to accessories used therewith not of our own manufacture.

Any part of a unit approved for remedy or exchange hereunder will be remedied or exchanged by the authorized radio dealer or wholesaler without charge in the owner.

This warranty is in lieu of all other warranties expressed or implied and no representative or person is authorized to assume for us any other liability in connection with the sale of our radio products.

ALIGNMENT F

- Use an amplitude modulated signal generator covering 185 KC to 31 MC
- Connect the output meter across the speaker voice coil.
- Use a non-metallic alignment tool
- Connect a 27-ohm carbon resistor between the generator and the receiver

Step	Signal Generator Connections	Generator Frequency	Band Selector Setting	Receiver Dial Setting	Adjust
1	High side through 0.01- μ f capacitor to pin 2 of V1; low side to chassis ground.	455 KC (modulated 30%)	2	Center of dial	Alignment points A, B, C, D, E, and F for maximum output. Reduce the generator output to maintain meter indication below 50 milliamperes.
2	High side through 27-ohm resistor to terminal A on rear panel; low side to terminal G.	1400 KC (modulated 30%)	2	1400 KC	Adjust C36 (oscillator) and C3 (antenna) for maximum output.
3	Same as step 2	550 KC (modulated 30%)	2	550 KC	Adjust L10 (oscillator) and L5 (antenna) for maximum output.
4	Same as step 2	...	2	...	Repeat steps 2 and 3 until no increase in output can be obtained with either adjustment.
5	Same as step 2	410 KC (modulated 30%)	1	40 KC	Adjust C38 (oscillator) and C7 (antenna) for maximum output.
6	Same as step 2	190 KC (modulated 30%)	1	190 KC	Adjust L11 (oscillator) for maximum output. L11 loop adjustment should not be necessary.
7	Same as step 2	Repeat steps 5 and 6 until no increase in output can be obtained with either adjustment. Then repeat steps 2 and 3.

NOTE 1 The local oscillator frequency is above the receiving signal on bands 2, 3, 4, and 5.

TUBE AND DIAL LAMP REPLACEMENT

For access to the tubes remove the three screws holding the rear panel in place and remove the panel. Care should be exercised to prevent damage to the leads from the loopstick antenna mounted on this panel (see CHASSIS REMOVAL).

CHASSIS REMOVAL

To remove the chassis, remove the four screws securing the chassis to the cabinet and slide the chassis out the rear of the cabinet.

CAUTION Before removing the chassis from the cabinet rotate the MAIN TUNING and BANDSPREAD controls fully counterclockwise to prevent damaging the variable capacitors.

Figure A. Restringing the Bandspread Control

PROCEDURE

- Set REC-STBY Switch to REC; AM/CW to AM; OFF-ANL to OFF; SENSITIVITY fully clockwise; VOLUME fully clockwise and BANDSPREAD at mid-scale for Bands 3, 4, and 5, fully counterclockwise for Bands 2 and 7.
- Refer to the top and bottom views for location of adjustments.

Step	Signal Generator Connections	Generator Frequency	Band Selector Setting	Receiver Dial Setting	Adjust
8	Same as step 2	4200 KC (modulated 30%)	3200	4200 KC	Adjust C34 (oscillator) and C4 (antenna) for maximum output.
9	Same as step 2	1900 KC (modulated 30%)	3	1900 KC	Adjust L9 (oscillator) and L2 (antenna) for maximum output.
10	Same as step 2	-----	3		Repeat steps 8 and 9 until no increase in output can be obtained with either adjustment.
11	Same as step 2	14 MC (modulated 30%)	4	14 MC	Adjust C32 (oscillator) and C5 (antenna) for maximum output.
12	Same as step 2	5.0 MC (modulated 30%)	4	5.0 MC	Adjust L3 (oscillator) and L3 (antenna) for maximum output.
13	Same as step 2	---	4		Repeat steps 11 and 12 until no increase in output can be obtained with either adjustment.
14	Same as step 2	30.0 MC (modulated 30%)	5	30.0 MC	Adjust C30 (oscillator) and C6 (antenna) for maximum output.
15	Same as step 2	15.0 MC (modulated 30%)	5	15.0 MC	Adjust L7 (oscillator) and L4 (antenna) for maximum output.
16	Same as step 2	---	5		Repeat steps 14 and 15 until no increase in output can be obtained with either adjustment.

and a lower than the incoming signal on band 5.

DIAL CORD RESTRINGING

- Remove the chassis from the cabinet to restore either dial cord (see CHASSIS REMOVAL). Remove the dial scale by removing two screws; remove the dial plate by removing four hex-head screws. Removing the dial plate provides complete access to the drive pulleys. Exercise care when removing the dial plate to prevent damage to the pointers. Follow the arrows and number sequence in figure A for the main tuning dial and figure B for the logging scale dial. The dial cord springs should be expanded from one-quarter inch to one-half inch. Engage the dial cord with the pointer clips; replace the dial plate and dial scale. With the MAIN TUNING and BANDSPREAD controls fully counterclockwise, align the pointers to the mark on the dial scale and apply a drop of cement to the dial cord and pointer clip. Replace the chassis in the cabinet.
